so called 'digital' digits ???? ;-)

Anyhow:
If you use GFA basic:
For PRINT all ascii below 32 are indeed control characters,
but not for TEXT
So
TEXT x,y,string$
will do it.
x,y are pixel positions.

Success

Many thanks to all the wizards here who helped me with my first GEM program. It is running and doing more or less what I wanted... now, if only the system I was controlling (X10) were more responsive, I'd really have something here.

Special thanks to Ulrich and Swampdog for a lot of textual and binary support.

I must say, after this brief but intense experience, that GEM programming blows Windows stuff out of the water. Of course, I'm biased, but having the screen objects as memory structures you can deal with directly is SO much more elegant than the Win32 API stuff that microslurp tries to hide from you with MFC.

In GFA I think you can use something like PRINT CHR$(255+16) if I
remember correctly.

iirc, you need to use Bconout with its handle changed from BC_CON to
BC_RAW. I forget the values for those names but no doubt it'll jog
someone else's memory.

As far as cross-compilers (if I understand your need correctly) is
concerned, about all I can think of is GCC. Never used it myself but
as it and sources are available for both machines then even if someone
else hasn't done it before, it should be possible to replace the PC
GCC code generator with a 68K one. Ditto the libraries.

Why not just run an emulator? That way you can test the code on the PC
as well?

I've been using Personal Finance Manager Plus 1.04 by Peter Veal for years now, and am very happy with it. One thing that's lacking though is the ability to import/export data in a common format ie. comma delimited etc.

Has anyone already written a import/export program that works with PFM+? If not, I might write one myself, and wondered if anyone knows the actual format of the .MNY file (it would save me having to dig around and guess). Anyone?

Gary

: it... AND IF POSSIBLE it would be running on DOS... so what i need is a C
: compiler that runs under DOS (or WinSton) and compiles to ST (PRG or TOS or
: whatever)..

2 Options:

- Get the sources for Sozobon C (should be on some FTP site somewhere,
I got them once...) and compile these on a PC.
The resulting binaries will run under DOS and simply generate Atari
code, using the Atari libs. This should be fairly easy to do if you have
a C-compiler for DOS.

- Compile GCC as a cross-compiler for DOS. This is _not_ a trivial task
(The easiest way would be to use Linux and a DOS cross-compiler :-/)
There might already be a m68k-TOS GCC cross-compiler available for DOS,
though... (I know there is one for Linux)

OR you could indeed download Sozobon, GCC, Heat 'n Serve or C68 and install
and run it using an emulator. Not as fast, but a lot easier. :-)

No you can't.

Well, you could actually, if you had one of those very rare adapters
that were hardly ever sold and that use to cost nearly the price of a
new laser printer.

Once there were made interfaces that plugged into the Falcon and
bypassed totally that small SLM box. The thick printercable itself
went on the (I think ROM-port?) interface.

But never seem it any more the last years.

I remember because te programmers did not know about the two
different SLM804 series that are around.

In short, no. However, if you have a spare ST, then you can network
them together and share the printers. There are several utilities
to perform this.

Some who want to ride this high horse may need to learn something
about providing a quality product in exchange for bug-free money.

If I purchased version 1 in the box at retail price, why must I
buy version 2 -- which contains features that I may not care
about -- to get the bug fixes for version 1? And why did version
1 even get out the door with all those bugs?

I bought version 1 because it advertised features that would meet
my need. The bugs were in my way and wasted my time. Why is my
time -- wasted because of the developer's negligence -- worth
nothing in this exchange?

If version 1 worked as advertised, it would still meet the needs
I bought it for in the first place. Witness Quattro Pro version
1 for DOS -- I still use it. That hurt Borland, but I don't
see software developers as charities to be funded for the
betterment of humankind. They are vendors whom I expect to sell
me a working product.

If an auto manufacturer sold cars that ran into the curb daily,
there would be a national recall at their expense. If software
crashes my computer daily, the vendor hides behind their
disclaimer and offers to sell me the 'upgrade'. What is wrong
with this picture?

Hi Sysops,

Please e-mail me, I want to connect the other side of the world again....
We have lost contact with lots of BBS systems overthere (USA/CANADA etc).
I am located in the Netherlands (EUROPE) and I want to network with all
active systems.
Please mail me and we can set-up a network again....

Our network at this point includes 3 running boards in the Netherlands, 2
boards in Germany and at least 1 board in the USA (*this connection has been
lost).

I am looking for the boards/network that is located in Sweden, Italy,
Canada,USA and other country's

PLEASE

Call +31-416-561927 300-19200 24hr/7days
-= The Underground Node #472 BBS =- Running BBS Express Pro! 5.0b

Or e-mail to: SysopTXG@underground.demon.nl

When you are running another BBS and/or network on the 8-bit ATARI please
mail me, because we can
look if we can connect it by writting some converter software....

BBS Express Pro! can export and import QWK files so that could be one
solution but maybe there are
some other possibility's too...

I think you attack another problem here:

* The original one is the problem of author's rights. I must agree with the
cited statement that an author of something has full control over his
product, while the audience has none. We (the audience) can not REQUEST
of the author to give his creation away. If we believe that he has
abandoned it or doesn't expect any profit from it anymore, we can
just ASK POLITELY if he might be willing to make it free for everyone,
so that its use may be prolonged, it may become widespread, etc. etc.
(any plausible explanation). And then we should be grateful to him
for being generous.

* It is quite a different problem what we (the buyers) get for our money
when we purchase software. I quite agree with you that the present
situation is humiliating because software author(s) usually make a

disclaimer that amounts to a statement that he does not guarantee his software does anything at all, and you use it at your own risk. Moreover, in most cases, you do not actually buy software, you just buy the rights to use it. In some cases you may not even sell your copy to another user, because you are requested to fill-in the end-user-certificate (the purpose of this usually being to prevent politically-disliked users from getting advanced software).

Unfortunately, I think that by the act of paying for the software, and knowing of the said disclaimers and conditions, you actually agree to anything the author(s)/owner(s) request of you, and you have no more rights, except those explicitely stated in documents accompanying the sale.

On the other hand there are (rare) situations where you can actually BUY software, usually including the source code, and can do with it whatever you want and distribute it as you like. Some times that may be almost equivalent to author's handing over his authorship to you.

And there ARE situations where the software is sold or licensed WITH a guarantee that it will do what it is advertised to do. For example, I think that the beautiful QNX real-time operating system for the PCs has some US-government certificates clearing its use in human-life-support devices and similar critical equipment. It may be said that this is practically a guarantee that it will do what it is told to do.

Cu.

>Some who want to ride this high horse may need to learn something
>about providing a quality product in exchange for bug-free money.

1: IT IS IMPOSSIBLE TO CREATE 100% BUG-FREE SOFTWARE.

This isn't an excuse for lazy programming. It is a *scientifically proven FACT*. Computer programs are complex systems and, as such, just as liable to the whims of Chaos Theory as the weather. The more variables a programmer has to deal with, the more likelihood of bugs there will be. PERIOD.

Consoles have far fewer variables than Windows PCs. Even Macs, Unix, BeOS and Linux have far less hardware to cope with than Windows. Microsoft's very success is its biggest enemy. Windows has to cope with hardware and software combinations so numerous that you'd need a warehouse the size of *Texas* to contain PCs running every single possible permutation. It simply cannot be done at a reasonable cost.

The same problem applies to PC games. There is no way on Earth for a game developer to afford enough PCs and testers to test their games on every single permutation and combination of PC hardware and software available to their customers.

It is possible to buy two computers, each using *entirely* different sets of components (even the CPU doesn't need to come from Intel), yet they can both run most PC games.

Ask any well-informed IT expert and they'll assert that it's a bloody miracle PC software works *at all*.

2: IT *IS* POSSIBLE TO REFUSE TO BUY SOFTWARE THAT HAS BUGS IN IT.

Nobody - and I repeat: NOBODY - is forcing you to buy a buggy game at gunpoint. Good magazines *will* highlight major bugs. Frequenting newsgroups, and just listening to word-of mouth will also help you decide whether you're willing to put up with a game with "Known Problems" that will show up on your particular computer.

It is ALSO possible to return *ANY* game to the shop it was bought from and ask for a refund, if you can prove it was "not of merchantable quality". If a game is refusing to run on your PC, IT IS NOT SUITABLE FOR THE PURPOSE FOR WHICH IT WAS BOUGHT, therefore you ARE entitled to a refund.

In most Western countries, this is a *statutory* right. Any computer games retailer who operates a "No Refunds" policy should be reported to the police, as they are breaking the law.

It's amazing how quickly the words "I'll see you..." and "...in court" can change the attitude of a shopkeeper. Especially when they're pronounced clearly, succinctly, and *loudly* in front of an audience.

[...]

>If an auto manufacturer sold cars that ran into the curb daily,
>there would be a national recall at their expense.

Cars *do* run into curbs daily. They are guided missiles, with *humans* as the guides. As a design, the automobile is one of the most lethal ever to be allowed out in public.

Cars kill *hundreds* of people every damned day of the year. This, IMHO, is a MAJOR 'bug' - and one that sits at the design level, no less.

The technology ALREADY exists to prevent the vast majority of deaths by car, yet, like lambs to the slaughter, people *still* buy them.

Compared to automobiles, I'd say buggy games are an incredibly petty worry.

There are GDOS and NVDI drivers for this printer, and the good news is that
most serious software that doesn't use GDOS technology to print usually has
a driver included.

If you want to print plain text from the desktop then you should look out
for the LaserBrain Epson emulator and maybe the Diablo emulator from one of
the Atari FTP sites.

The drum and toner will be hard to get hold of nowadays.

<stimarco@solarflair.ndirect.co.uk> wrote:

>Computer programs are complex systems and, as such, just
>as liable to the whims of Chaos Theory as the weather.

My understanding of Chaos Theory is that it arises out of the
fact that things are unknowable on scales smaller than we can
deal with.

I am not aware that anyone has identified 'sub-bit' entities in
the software environment comparable to subatomic particles in the
physical world.

The smallest iota in the software environment is perceivable. To
the extent that Chaos Theory applies here it is not because
something is unknowable -- it is because sufficient effort has
not been made to make it known. And when enough things are
unknown and taken en masse, Chaos Theory may apply. This is a
novel form of expectation -- hoping for enough ignorance to make
a theory applicable.

What wound my watch here was someone talking loudly about the
rights of software developers when they demand payment and
disavow any responsibility for grief they cause me.

I paid for a machine that has firmware to support an operating
system that I bought to run applications that cost me money.
When an application hiccups and wastes days of my time, my job
just got harder because someone else -- whom I paid somewhere
along the way -- didn't do their job completely.

I didn't say their job was easy. If it were, anyone could do it.
Do they assume that my job is so easy or irrelevant that hiccups
don't matter?

I make enough of my own mistakes. I'm fortunate if I can sort
enough of those out. I don't need to sort out someone else's
mistakes to fill a quota.

Developers do well to bear in mind that my ability to pay for
'upgrades' is enhanced if I'm not wasting otherwise productive
time fighting their bugs -- or grousing about them on a ng.

In no way did I intend "they" to refer to Mr. Mates, to whose post I
initially reacted. I have no knowledge of any of his products. I
meant "they" in the generic sense. I switched references for my
pronouns at mid-sentence.

My apologies to Mr. Mates for any confusion. He did not contact me.
The sentence just seemed vague upon rereading it and I want to make it
clear that no personal attack was intended.

Nor did I mean to suggest that Mr.Baggaley has novel expectations. He
didn't contact me either ...

I hope that covers everyone. I am disturbed -- and inconvenienced --
by what I see as an industry mindset. Any perceived personal barbs
are unintentional.

I have heard of a story (I believe it's true as it came from a reliable
source) about a US Warship which was modified to run WinNT as it's OS.
It had to be towed back to port when the OS crashed.

Hi Nathan,

> If a sculptor says that their creation will be shown for a month at
> museum X, and then it'll be destroyed, THAT'S THEIR RIGHT TO DO SO.

That isn't the truth. Copyright exists in the _form_ of a work, and is
completely seperate from ownership of the materials.

A copyright holder has no particular right to insist that a lawfully copied
work must be destroyed.

> If a software company wants to never support or re-release something
> after its initial printing, THAT'S THEIR RIGHT TO DO SO. You have no
> right to argue with them, you have no rights to think better than
> them and decide how something should be distributed.

You always have the right to argue -- one of democracies greatest virtues and
greatest vices. At the end of the day, if a software house is no longer
making any money from a work and nor would it loose any money from the
copying of a work then the public are pretty much free to do with it as they
please. There is no element of criminality, and British courts do not award
punitive damages in civil cases. The most a Copyright holder could do is get
an injunction, and TBH who is going to be so minded when there is no money
but only ill sentiment to be gained?

Deal with reason and reason will deal with you, that is after all what law is
all about.

John.

It was called "BRender", was ludicrously overhyped and, because it came out just before decent 3D accelerators came onto the market, it proved to be nowhere near as useful as they thought it was. (Remember the dire 'FX Fighter' game?) It was about as popular as a pyromaniac in a fireworks factory, and appears to have been put to sleep.

MS bought up a 3D library created by US-based Rendermorphics. That, too, was a steaming pile of overrated shite. It exists in DirectX as part of the legacy, universally-loathed, 'Retained Mode' portion of Direct3D. Most use the far superior 'Immediate Mode' Direct3D API routines, as these provide much more powerful facilities. (It is unlikely that 'Retained Mode' will be maintained to any great degree, since MS and SGI are apparently working on a replacement scene management API based on OpenGL.)

Well, yes and no.

The warship was the Yorktown, which was the test ship for the Navy's SmartShip program. This ship is part of an X-program, similar to the Air Force' X-1 through X-15. One way to state the charter of an X-program is, "If it ain't broke, you didn't push it hard enough." IOW, the entire point of the exercise is not to prove that it works, but to quickly and fairly inexpensively test stuff you think might not work. Find out early the areas where your group's knowledge is weak so that you can focus attention and funds on those areas. The SmartShip program is years from being considered ready for installation. It's pre-alpha software.

I believe that the specific fault was a divide by zero in a database application that crashed the app and corrupted a database to the point where it couldn't be fixed on-site. It's unclear to me whether that crashed the OS itself.

If you're interested check out http://www.jerrypournelle.com/REPORTS/JERRYP/Yorktown.html for some correspondence on the incident with pointers to more info.

Windows and NT are not mission critical OS's -- you will not see either
running a launch of the space shuttle in the near future.

Yes, complex programs are harder to implement correctly than simple
programs. That doesn't support your hypothesis that bug-free software
is impossible.

>2: IT *IS* POSSIBLE TO REFUSE TO BUY SOFTWARE THAT HAS BUGS IN IT.

According to your first point, that would simply mean refusing to buy
any software at all. ;-)

>Nobody - and I repeat: NOBODY - is forcing you to buy a buggy game at
>gunpoint.

I agree with that!

>It is ALSO possible to return *ANY* game to the shop it was bought from
>and ask for a refund, if you can prove it was "not of merchantable
>quality". If a game is refusing to run on your PC, IT IS NOT SUITABLE
>FOR THE PURPOSE FOR WHICH IT WAS BOUGHT, therefore you ARE entitled to
>a refund.

Well, of course you can always ASK for a refund. Just because
something you bought doesn't do what you expected does not mean that
you are entitled to a refund, though.

I once bought a nylon rope to pull my car out of a snowy driveway. We
tied it between the car and another, pulled, and got the car moving
until it went off an embankment after cutting the rope on a bumper (I
finally got a tow truck). I expected the rope to get my car out
safely, but it didn't happen. It probably didn't say it would pull
cars out of stuck positions and I took the risk that it might not work
for my purpose when I bought it.

If the label on the box guarantees that it will run on any class of
systems that covers your computer, then take it back if it doesn't

work. I have no problem with a business having a no-refunds policy.
I just might choose to shop elsewhere. Caveat emptor.

>In most Western countries, this is a *statutory* right. Any computer
>games retailer who operates a "No Refunds" policy should be reported to
>the police, as they are breaking the law.

I seriously doubt that, especially if it was conspicuously posted.

>It's amazing how quickly the words "I'll see you..." and "...in court"
>can change the attitude of a shopkeeper. Especially when they're
>pronounced clearly, succinctly, and *loudly* in front of an audience.

You are right that most businesses would do that as a matter of
maintaining good customer relationships.

>I seriously doubt that, especially if it was conspicuously posted.

Call the police is not done, but the law in my country is quite
clear: a refund in real money if the product doen not perform as
indicated on the parcel, in advertising etc.

But most managers and shop owners think that that law is not for them
and you. And there are many lawyers taking up the case for the seller.
And always loosing on court, but that they do not tell their
customers....

If functioning/not funcioning can only be expirienced by opening the
parcel, breaking the seal etc. then the story: 'it is opened and
used' is not valid in court.

But who takes the trouble going to court? Only rich people can pay
that.

>Yes, complex programs are harder to implement correctly than simple
>programs. That doesn't support your hypothesis that bug-free software
>is impossible.

Depends on the complexity of the platform. Small, simple games can be as near-as-dammit bug-free as it is possible to get. NOBODY can guarantee 100% that it will run on any one particular system, though. On the PC, developers simply have no way of knowing in advance what other software you have installed or what other hardware you have installed. (This is why Macs and consoles tend to get far fewer problems with buggy software releases.)

As the platform becomes more complex - and the PC is about to have *two* new hardware bus standards foisted upon it, as well as Rambus technology - then the likelihood of a clash between different software / hardware combinations increases.

Someone asserted that Chaos Theory only applies to unknowable "natural laws". Software *IS* a definition of laws for the computer to follow. I've seen no valid reason why Chaos Theory should only apply to "natural" laws, so I assert the view that Chaos Theory applies to *any* area where some laws are unknowable.

On the PC, the developer has *NO WAY* of knowing which software laws are being obeyed by your particular machine, so it is impossible to ensure 100% perfection.

This isn't a perfect world.

>>2: IT *IS* POSSIBLE TO REFUSE TO BUY SOFTWARE THAT HAS BUGS IN IT.

>According to your first point, that would simply mean refusing to buy
>any software at all. ;-)

Not really. A well-programmed console game could be assumed to have a
negligible number of bugs.

The point is to pick and choose which *grade* of bugs you're willing to
put up with. Console games are simply not allowed to 'blue screen' the
machine; they won't be passed by Sony / Nintendo / Sega's QA
departments if they do. And there is very little excuse for doing so
anyway, since a console is a single-tasking machine with a wholly known
suite of software. (Barring anything the manufacturer isn't telling
anyone about.)

On a PC, 'stupid' bugs should not be there. Stupid fatal errors of the
"Oh look! My installer mis-copied some files, so I'd better crash the
machine silly" variety. These are inexcusable, since these bugs are
wholly under the developer's control.

However, it is possible that you may get a 'blue-screen' bug if you've
just installed a swanky new graphics card (with its new, relatively
untested drivers), which wasn't even designed at the time of a game's
launch. In these cases, the fault actually lies in the hardware
manufacturer, rather than the game. If you've only just bought the
game, then you can still return it, since it no longer fulfills the
"Merchantability" aspect of the unwritten contract between buyer and
seller.

(IMPORTANT NOTE: I'm using my knowledge of UK (and some EU) laws and
regulations here, since I know little of how the US retailing laws
work. Presumably, the US has similar protection, but then again, it may
not.)

>>Nobody - and I repeat: NOBODY - is forcing you to buy a buggy game at
>>gunpoint.

>I agree with that!

>>It is ALSO possible to return *ANY* game to the shop it was bought
from
>>and ask for a refund, if you can prove it was "not of merchantable
>>quality". If a game is refusing to run on your PC, IT IS NOT SUITABLE
>>FOR THE PURPOSE FOR WHICH IT WAS BOUGHT, therefore you ARE entitled
to
>>a refund.

>Well, of course you can always ASK for a refund. Just because
>something you bought doesn't do what you expected does not mean that
>you are entitled to a refund, though.

You are so entitled (in the UK, at least) if it the contract between
buyer and seller is broken on the part of the seller. It is pretty
f*cking obvious that you're buying a game to play on *YOUR* PC, so if
the game fails to run on *YOUR* PC, the game is not of merchantable

quality.

If your PC is a Pentium 166 MMX with all the trimmings, and the box states "Minimum Requirements: Pentium 75 with all the trimmings", then you are within your rights to assume it will work on your PC. This is part of the implicit contract between a buyer and a seller.

>I once bought a nylon rope to pull my car out of a snowy driveway. We
>tied it between the car and another, pulled, and got the car moving
>until it went off an embankment after cutting the rope on a bumper (I
>finally got a tow truck). I expected the rope to get my car out
>safely, but it didn't happen. It probably didn't say it would pull
>cars out of stuck positions and I took the risk that it might not work
>for my purpose when I bought it.

Irrelevant.

This is like complaining about a game not running on your 486, even though it quite clearly states: "Min. Spec.: Pentium III running at 500MHz" on the box. In these cases, "Caveat Emptor" applies; shopkeepers aren't expected to read minds, and neither are they expected to be experts in the field of computer games.

It is up to the *buyer* to ensure they have taken every precaution. If the information provided by the retailer was wrong, or misleading, (eg: if the 'minimum spec' is clearly grossly inaccurate), then you are within your rights to return it, since the fault lies with the retailer.

IMPORTANT NOTE #2: The 'contract' in any such case is between YOU (the buyer), and the retailer (the seller). AT NO POINT IS THE PUBLISHER OR DEVELOPER INVOLVED. If you find that the 'minimum specs' are incorrect, the retailer HAS to provide a refund. After that, it is up to the retailer to then take up the matter with the publisher or distributor, since that is a SEPARATE contract.

This aspect often confuses people, but is well worth bearing in mind. If your retailer insists that you send the box back 'directly to the publisher', then *they* are breaking the contract between you and they. On NO account should you do this, otherwise the law will deem you to have agreed to the retailer's terms, and your original contract will be null and void.

(Note that a contract can be legally binding, even if it only ever exists in verbal form.)

>If the label on the box guarantees that it will run on any class of
>systems that covers your computer, then take it back if it doesn't
>work. I have no problem with a business having a no-refunds policy.
>I just might choose to shop elsewhere. Caveat emptor.

I do have a problem. In the US, you may put up with that sort of thing. In the UK, it really is illegal for a computer games retailer (and most

other classes of retailer) to have such a policy.

Don't forget, *about 50%* of the box price of any game *goes to the retailer*. The rest gets split (about 50/50) with the publisher and the distributor. The publisher then has to use its share to pay for the development costs.

When seen in that light, it's pretty obvious why many developers really wouldn't mind seeing online gaming and Internet distribution / retailing take off in a big way. Why have *three* middle-men when you can deal direct?

>>In most Western countries, this is a *statutory* right. Any computer
>>games retailer who operates a "No Refunds" policy should be reported to
>>the police, as they are breaking the law.

>I seriously doubt that, especially if it was conspicuously posted.

Nope. Read the law.

Many unscrupulous retailers will try that ploy, if only to put off the wallflowers and cut down on their returns. But that doesn't make it legal; they just have to be caught doing it. (There's no actual law that says it's illegal to *display* such a sign, but there is a law which prevents it from being valid.)

However, in the US, your mileage may vary...

>>It's amazing how quickly the words "I'll see you..." and "...in court"
>>can change the attitude of a shopkeeper. Especially when they're
>>pronounced clearly, succinctly, and *loudly* in front of an audience.

>You are right that most businesses would do that as a matter of
>maintaining good customer relationships.

And you'd be amazed at how few people would actually consider doing it.

*

There is a school of thought that believes "no refunds" retailers are only trying to prevent piracy. This is bullshit. Retailers couldn't care less, since they *never* lose out. They get to keep their share of the money, even for returned goods. The problem for them, is that it's a *hassle* to handle returns. They have to pay someone to pack it away, label the box, fill in forms, and so forth. Far easier to just try the "Which part of 'No Refunds' do you not understand?" ploy.

What was so bad about FX Fighter? I got a copy of that in a cd bundle,
and it wasn't too bad - I'm not a big fan of fighting games, but it
seemed alright.

Daft question but i've done this myself many a time in C ...

Have you called appl_init and appl_exit correctly? ;-)

>I'm using Devpac 3 and using the Gemmacro.i library.

rscname:
dc.b "c.rsc"
dc.b 0

The size of these doesn't matter, as long as they are all big enough
...

global: ds.w 15
control: ds.w 5
intin: ds.w 16
intout: ds.w 2
intout: ds.w 7
addrout: ds.w 1

Now put their base addresses into an Aes Parameter Block ...

apb:
dc.l control
global
intin
intout
addrin
addrout

The control arrays takes the rsrc_load opcode followed by the current
size of each of the intin,intout,addrin,addrout arrays ...

control[0] = 110
control[1] = 0
control[2] = 1
control[3] = 1
```

```
control[4] = 0

Shove the address of the resource file name here ...

addrin[0] = rscname

Address of apb -> d1
move.l #apb,d1

Aes id code -> d0
move.l #200,d0

trap 2

int_out[0] = result code (0 = error)

That's more or less it. If somebody else posts a better example then
go with that - I program in C and may have omitted something!

Source record: 3007

Hello,

We are currently building a system using the Atari Falcon 030 and its internal DSP (Motorola 56001). We overclocked the DSP to 50MHz already, but we would like to have sampling be done at 44.1kHz at the input port (the mic port).

Our project consists of sampling a sound in real-time, apply HRTF filters to it and output the sound through the headphones port.

We really need to use the FDI, since it can provide a steady clock at 44.1kHz, which should provide CD quality sampling and output... We believe we will need some DEV_CONNECT commands, but we have not yet found more info on the web for the use of the FDI...

Any help, tips, URLs, examples, would be really appreciated.

Thank you in advance
Eric Desfonds

It's true, here in California a man bought a dozen or so microsoft products and spent three weeks trying to install and run them. The experience convinced him never to use Microsoft again but, the store said they would only refund him for incomplete or damaged software after seven days. He tried arguing that the software was defective in it's 'complete' and 'undamaged' form. The courts agreed and the store was forced to give a refund to the man.

People didn't die "as a result of computer failure". The *computers*
were only doing what they were bloody told to do. It was the "people"
who failed.

Indeed, rather a large number of people had been screaming at them NOT
to use the system, since it was known to be unsafe. The system was
built by a company called Electronic Data Systems ("EDS"), and this
particular company as a long, long record of fuck-ups. They still make
regular appearances in Private Eye.

(Does anyone know of a project they've actually managed to get
right?)

You never know, there are users who still use the Speccy and with MIDI
as standard, the ST is a cheap MIDI instrument;)

Why buy a dedicated word processor (the ones with vdu, printer etc.. in
one unit.), when for half the price you can buy an Atari, printer,
monitor and entertainment software thrown in and is liable to be
supported longer than them.

After all why did many programmers not think that computers would be
around after the year 2000!!!

I look forward in supporting the Atari range for many years to come, and
if they are still around when I pop my clogs, I hope my kids, kids will
take on where I left off.

when I reply to articles, I think and type at the same time, just like
you would when having a one sided conversation. So I have thoughts that
pop into the absent area between my tabs (northern/midlands slang ears).

Why can't the ST's OS ROM's be modified, as there are plenty of spaces
that could be used to squeeze an extra bit of code.

I've got a Unison EPROM programmer, of which the people who created the
beast have told me that I can do virtually anything I want copyright
wise! (they also said I can have all the development material when they
can find them in their archives etc...)

Anyway, it's fine for the 27 series 28-pin dil EPROM's, what I could do
with is and adapter that allows me to use 32-pin EPROM's manually
switching between the blocks and plugs into the 2 ZIF sockets! or a
programmer that can already take them!

>>fixed.
>>
>
>Try setting the date as dd/mm/yyyy

That won't help. The TOS in all STs upto, and including, TOS 2.06 have a
problem with dates beyond 31/12/1999. As soon as the date is read from
the keyboard clock, which the XBIOS uses, the date will jump to 2028.
The same code exists in all the versions of TOS I've looked at, from
1.00 to 2.06, as well as Magic. There's only 3 ways round this. problem.

1: Load a patched version of TOS into RAM;
2: Use a patched version of Magic;
3: Find someone with an EPROM blower and blow a patched version of TOS
into EPROMs.

ATM, I'm using the second of these, although once I get MiNT installed
correctly, I'll have the problem back again :(

BTW, if you want some more info about the problem, Philip Taylor wrote a
good explanation about it, and how to solve it, in article:

Hello!

I was wondering how you put controls (buttons, sliders, etc.) directly onto a window in a ST program. I know how to create dialog boxes with controls using a resource editor, but I've never been able to discover how to do the same thing with a window.

I have an old Mega 4 with TOS 1.4, but I have none of the problems you
describe. The clock on the control panel duly jumps to 01/01/00 from
12/31/1999 to 01/01/2000, and when I set it to February 28, 2000
23:59:59, it goes correctly to February 29, 2000 after a second.
There's nothing wrong here, no millennium problem whatsoever with my
ST.

Similarly, it amazes me how Microsoft and PC manufacturers had the nerve
of selling systems with the Y2K bug up until 1998. The entire computer
industry should be prosecuted for this instead of making money on
"upgrades".

Except that, Microsoft (and many others) have the following clause:
"offers no warranty against misusage nor that the product is fit for
particular intended purpose"

In other words, they don't tell you how it's intended to be used,
nor do they guarantee it's fit for that unspoken purpose. In plain
English: you buy, we make money. No questions asked nor answered.

Same here (patched German TOS 3.06) - yet I had problems convincing my
TT030 of the dates as it's DCF77 receiver software corrected it much
too fast.

Considering a lot of the network card drivers for Linux were developed there, I'd say it's a good bet. :)

Linux has been used by LNL in their Loki and other systems for parallel processing. I wouldn't be surprised if a lot of graphics rendering was taking place on Linux platforms at places like NASA.

In french law, that sort of thing doesn't protect them from the "vice
cachï¿½" (hidden defects) regulations, that would apply here. I read an
interview in which the french minister responsable of fraud enforcement
was considering legal action in some such cases.

Does you Mega have a RTC built in? If it does, that could explain the
reason why you don't appear to have the same problem. AFAIK TOS looks to
see if there's a RTC and, if it there's one present, uses that to get
the time. If there isn't, it fetches the time from the keyboard.

It looks like the problem is going to only affect those STs without a
built in RTC which means that the pre-MegaSTs and the STE will be
affected. The MegaST(E)s, TTs and Falcons probably won't be affected.

In very short:

You create a window in which your dialogue fits.
Use wind_calc to get the outside measures from the inside.
You can specify all window gadgets including sliders and arrows
in 'wind_create'.

'wind_open' generates a redraw event which you can catch in
'evnt_multi', you then just draw the dialogue, using 'objc_draw'.
Allways by using the rectangle list!!

The best way to handle a dialogue in a window, is to turn form_do()
inside out and embed its inside calls in your own central
evnt_multi loop.

Henk.

P.S.
Set ob_x and ob_y of the dialogues root object allways
to x and y of the windows work area.
That's basicly the trick.

Henk.

I am looking for a AVR, WAV, SND and other audio file format decription -
byte by byte.
I am making a converter - I know there are some PDs but they are not fast
and with the
right options.
If you got decriptions, or know where I can find some please mail me on
psloth@post2.tele.dk

If `RTC' means `real time clock', the answer is yes. But real time
clocks are standard in the Mega, as in the MegaSTE and TT and Falcon,
as far as I know.

How about using the open source "sox" package as a starting point and optimize
it if you think that you can speed it up?

Hi you all.

A new spring,
a new version of the this interactive disassembler.

You now can:

Mark 16 bit PC relative jumptables and generate corresponding labels.
Quick find the appropppriate indirect jmp's and jsr's.
Give names to 'absolute word' operand addresses.
Give names to standard labels.
Attach a short comment to an address.

It is on my web page: http://people.a2000.nl/hrobbers/Homepage.html

Have fun

Henk Robbers.

That could explain it then. It appears as though the machines without a
RTC are the ones that will be affected. Those with one probably won't
have any problems.

In some Operating Systems it does that. That's why I wrote a program
which handles setting the date with 4 digits

>believe we will need some DEV_CONNECT commands, but we have not yet
>found more info on the web for the use of the FDI...

The FDI interface is controled by the three General Purpose Input Output
pins on the DSP port.
First these pins are set to funtion as output:
gpio(0,7); /* Set al 3 GPIO pins to output */
Next you can select or change wich frequency will by used by the FDI:
gpio(2,3); /* Set FDI to use 48KHz clock */
gpio(2,2); /* Set FDI to use 44.1KHz clock */
gpio(2,1); /* Set FDI to use external clock e.g. 32KHz from DAT recorder*/
Now the sound matrix may be connected in the way you want to use it with
the sourceclock set to external and the prescaler set to 1.

>but we would like to have sampling be done at 44.1kHz at the input port
>(the mic port).
>
>Our project consists of sampling a sound in real-time, apply
>HRTF filters to it and output the sound through the headphones port.

For your setup this could look somethink like this:
devconnect(adc, dsprec, srcclk, prescale, no_shake);
devconnect(dspxmit, dac, srcclk, prescale, no_shake);
with:
adc = 3
dsprec = 2
dspxmit = 1
dac = 8
srcclk = 1
prescale = 1;
no_shake = 1

However I found out that there may be som problems with the adc using the
FDI clock. This can perhaps be solved by making some more connections on
the sound matrix. E.g. first connect the extinp to the dsprec and next
changing it to connect the adc to dsprec.
So try to fidle around a bit with the sources and destinations in the devconnect command.

That's correct, PureC hasn't been updated or sold since 1992 (IIRC). It's a shame, but I believe ASH had some legal problems with Borland and just had to drop it. I don't think anybody has it in stock now, so you'll have to look for second-hand copies.

No this isn't a message about porn pics... ;)

I'm working on a project where I have a number of G_STRINGs in a
rsc file. The problem is as follows.

If I change the G_STRING to be equal to a static message in my
project, it will always redraw correctly.

However if I change the G_STRING to be equal to a message from an
external source, upon redraw it is corrupted, changed whatever you want to
call it. It's not what it was set to anymore.

Any ideas on where I'm going wrong? Or has the flu medicine
sapped the last of my mental abilities...

Well, all I can say is that this should work! If you set, for a G_STRING
object, the op_spec pointer to point to a string, it should display that
string. I suggest you make sure you set the ob_spec correctly. If you are
sure you do, check that the string pointed to by the ob_spec is indeed
intact. I've done this plenty times, and it works, so I'm quite sure its
not a AES problem...

In this case it was a modem. I finally found my problem. It was
a dual problem actually.

First I was directly manipulating the pointers of the ob_spec, so
of course temporary strings were lost.

Secondly after I modified that to be a strcpy, I discovered that
part of my strings weren't terminated. All seems to be fine now.

Thanks everyone,

3045. MagiC Documentation Project

Newsgroup: comp.sys.atari.programmer
Date: 1999-03-28 00:00:00 UTC
From: John Whalley <news@whalley.demon.co.uk>
Message-ID: <01be78f7$cbae3700$LocalHost@xpnwjjkf>
Source record: 2912
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi,

For a long time now, many programmers have been complaining that there are no programming docs for MagiC in English, and the MagiC author (Andreas Kromke) doesn't have the time to do his own translation.

Some of you may recall back in January a brief discussion about the lack of English programming docs for MagiC. Guy Harrison suggested starting a "community project" in the form of a web site where people could download parts of the German documentation and submit translations.

As a result, I've been in touch with Dr Kromke, who has kindly given permission to go ahead with the project, and has supplied the latest docs for MagiC. I've set up a pilot project with a few files initially, as the docs are extensive (the archive unpacks to over a megabyte). It's at:

http://www.whalley.demon.co.uk/atari/mdp/

The idea behind this site is to make available the German docs in easily-digestible (and downloadable) chunks for people to translate as and when they have the time and inclination. I myself have no German worth speaking of and I'm not a programmer either, so my role in this is purely as host for the pages and co-ordinator (where necessary) for the results.

The site also includes info on translation tools to help get you started.

All help will be gratefully received! Please take a look and contribute if you are able.

Thanks,
John

3046. [Slightly OT] Lattice and Pacifist

Newsgroup: comp.sys.atari.programmer
Date: 1999-03-28 00:00:00 UTC
From: odonnllb@vax1.tcd.ie
Message-ID: <1999Mar28.175450@vax1.tcd.ie>
Source record: 2913

I occasionally use Lattice (5.06) on Pacifist -it's quicker than switching on the ST and transferring stuff by floppy (Don't ask), and I have a very annoying problem.
Lattice will overwrite an object file, but absolutely refuses to overwrite the actual program file, so I have to delete the previous version by hand.
Any ideas about what I'm doing wrong - apart from using a PC?

It's not actually called mdp, that's just the name of the directory it's in
on my web site. It's called the MagiC Documentation Project. However, if
it's going to cause confusion, I could change the directory name. Is it
likely to be a big problem, as anyone seeing the full name should have no
doubt as to what this is?

```
Hello,

I have a complete Atari Falcon 030 system for sale for 350gbp ono.

This does not include shipping - I would prefer a buyer to
collect so that they can assure themselves that everything
is working before taking it away - I live in Newcastle upon Tyne.

See below for a complete description. Any questions, feel free to
email me.

Michael
--
# To send me an email substitute @ for % in this address:
# michael.clemmetsen%syntegra.bt.co.uk

------------------ cut here ------------------
** Falcon System **
4MB RAM, no internal IDE
External 520MB SCSI drive and Falcon SCSI to 50w SCSI connector.
Loaded and configured with the software listed below as well as
loads of freeware, shareware and demos mainly downloaded from the
internet.
(Seagate mechanism - ST3655N, including technical
documentation.
The drive is internally terminated so you do not need a
terminator, but will have to put it at the end of the SCSI
chain if you use any other devices.)
ClockPatch fitted (by System Solutions)
(Required for accurate Direct to Disk recording)
TT Keys fitted
(High quality replacement keyboard contact cups that
improve the keyboard feel -you'll definitely notice
the difference if you are a touch typist)
Falcon VDU port to VGA adapter cable
(required to connect to a SVGA or VGA monitor)
BlowUp Hard II
(Hardware attachment that plugs into the cartridge port
providing a faster horizontal sync, thereby allowing
higher resolutions on suitable monitors, i.e. those
that can take a variable horizontal synch signal up to
50KHz. Includes software drivers and manual. The software
can be used without the hardware if the monitor is
unsuitable, i.e. lower refresh rates have to be used.)
2 Mice
```

(Not Atari, i.e. better microswitched devices)

Tabby graphics tablet
(Approximately A5 size, including software drivers and manual)

SVGA Monitor
(Includes Polarising screen filter. Works well with the BlowUp
software, providing resolutions around 800x520,
depending on colour depth.)

Epson LQ100 24pin dot-matrix printer including Manual

** Commercial Software **
All are english language versions and are complete with
original disks and manuals.
* System
HD Driver 6
(Hard disk driver including format and setup)
NVDI 4.02
(Display accelerator and TrueType and Speedo Font
display and printing.
Including over 40 high quality Truetype fonts.)
Magic 5.13
(Pre-emptive multi-tasking operating system,
including support for Windows compatible
long file names)
Kobold 2.5
(Fast file copier and file management tool)
Geneva 006
(Co-operative multi-tasking operating system)
NeoDesk 4 005
(Replacement Desktop integrates seamlessly
with Geneva but also works with Magic)
NeoDesk CLI 2
(Command line interface that integrates with NeoDesk)

* Productivity
Papyrus 5.15
(The best word processor/pagelayout application
on the Atari platform. Includes features, such as
discontinuous selection not available in MS Word.
Can import and export to MS Word)
Calamus S
(Premier DTP app.)
Twist 2
(Relational Database)
Apex Media
(Falcon only graphics and animation app.)

* Programming
Lattice C 5.52
(Professional C compiler that can target all 680x0

processors. Comes with libraries and documentation for
creating fully compliant GEM programs.)
HiSoft C
(C interpreter. May not work on the Falcon, but useful
for its GEM library which could be used with Lattice)

* Games
The Killing Cloud
(3D point of view strategy/flight sim/shootemup in
21st Century Los Angeles.
May work on the Falcon using one of the ST
compatability programs e.g. Backwards)
Epic
(3D point of view strategy/flight sim/shootemup in
space and on distant planets.
May work on the Falcon using one of the ST
compatability programs e.g. Backwards)
Frontier - Elite II
(This works fine on the Falcon and can run from the
hard disk)

** Books & Manuals & Magazines **
Falcon System Manual
CalApp User Guide
(Calendar and Appointment Software supplied with Falcon)

The Atari Compendium by Scott Sanders (2 volumes)
Modern Atari System Software (HiSoft)
(Both these books are essential for any serious
Atari software development as they document all
the system calls and style guidelines for all
released versions of the TOS operating system.
As far as I know none of them are published anymore

Atari World - issues 1 to 11 inclusive

** Other **
Box of floppy disks with a variety of public domain, freeware
and shareware software, e.g. MiNT and a bunch of MiNT related
tools and utilities.

A few cables that may be of use.

Seriously, though, in the absence of a flood of confused people I'll probably leave it as it is, having just publicised the thing. Anyone linking to the site or mentioning it in newsgroups etc is going to use the word MagiC somewhere (which is a bit of a giveaway, no?), so I don't really see how altering a directory name is going to make much difference. Unless it looks like someone's going to try to start another pointless OS war (for the record, I mostly use MagiC, but I also have a MiNT setup and regard the two OSes as having different strengths and weaknesses: you use whichever is appropriate to your needs).

TT-Digger is a disassembler. It recognizes code and translates it
to machine code instructions. It is intended for analysing or reading
code of which you do not have the sources.
!!It is forbidden to use it for reverse engeneering.!!
It is a powerfull tool for pinpointing bugs however.

Henk.

3058. Toolbox DLL engine

Newsgroup: comp.sys.atari.programmer
Date: 1999-04-01 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <7dupuomrs1@newshost.comnet.co.nz>
Source record: 2925

The Toolbox is nearly ready to go to beta test.

The Toolbox is a DLL engine (written entirely in 68k assembly language) for the Atari ST family of computers, and requires just 32k of RAM for itself, and a computer running TOS 1.0 or better.

The archive (about 60 kbytes, uncompressed it totals around 150k) contains the Toolbox itself, example source code for a Toolbox library and an example application to use that library (designed around Lattice C 5.60, but should be usable with other languages), a CPX to configure libraries, and an accessory to display libraries that are currently loaded, and a few bare-bones manuals.

What is currently needed is a selection of people with varied computers to torture-test the Toolbox and supplied utils, and to write libraries and applications that use the Toolbox.

What exactly is the limit with v_gtext()? Hitherto I checked with vqt_extent() whether the extent if the string wasn't longer that twice the window width, and this works perfectly with mono-spaced fonts, even with large screens, but strangely enough it doesn't work with proportional fonts and very wide windows. Specifically, it doesn't work on a 17" monitor with the window set to full screen size. It seems there is an absolute extent beyond which v_gtext() warps the lines on screen, but how big is it?

I suppose you use a C compiler.
It shouldnt be limited at all.
The interface allows you to pass the number of entries in the
intin array. Unfortunately a bunch of compilers use global
static arrays for all those AES & VDI arrays. That is what is limiting
you.

There is nothing against rewriting the library module for v_gtext
in which you use the existing global array in a own local defined
aespb with all the other arrays locally declared with the length you want
them to have.

Henk.

Methinks there'll be lots of factors. The standard font table has
(iirc) only 8 bit character offsets. These may get translated into
bugs or simply mean a limit of round about 256 chars on a line. I
wouldn't expect NVDI to suffer from this kind of problem though, or a
proportional non standard font, like a TrueType.

Memory might be an issue. If the reserved cache size has been exceeded
then this might trigger a bug in NVDI.

I'm starting to waffle. Lets see the code! :-)

I'm not sure I understand this correctly. I use PureC and the
prototype for v_gtext is

void v_gtext(int handle,int x,int y,char *string);

I suppose I could rewrite the library function, but then I don't have
the source code and don't know what AES/VDI calls it uses, or whether
it employs global arrays. In the latter case: I wonder why it
shouldn't constrict itself with a simple sizeof() operation.

Source record: 2938

on Fri 02-04-1999 21:44 Guy Harrison wrote:

>Care to post a snippet of code that causes this problem?

Well, take this for example:

```
void draw_line(int whdl)
{
char s[2000+1];
int pxy[4];
extern int vdi_handle;

memset(s,'b',sizeof(s)); /* or choose any character */
s[2000]='\0';

wind_get(whdl,WF_WORKXYWH,&pxy[0],&pxy[1],&pxy[2],&pxy[3])
pxy[2] += pxy[0]-1;
pxy[3] += pxy[1]-1;

vs_clip(vdi_handle,1,pxy);

v_gtext(vdi_handle,pxy[0],pxy[1],s);

... function for setting horizontal slider size and position

vs_clip(vdi_handle,0,pxy);
}
```

Now, if you do this, you will probably notice right away, and certainly after scrolling horizontally, that the line gets warped. The bug is independent of whether GDOS or NVDI or whatever is resident.

The solution which I have hitherto employed was to check if the extent of the string exceeds twice the window width and then truncate the string, if necessary:

```
int extent[8];
vqt_extent(vdi_handle,s,extent);
if (extent[4]>(pxy[2]-pxy[0]+1))
s[get_linepos(s,pxy[0],pxy[2])]='\0';
```

(The function get_linepos() calculates the position in the character array where the extent would exceed window width.)

This works perfectly with mono-spaced fonts, even with large screens, but it doesn't always work with proportional fonts. It works with "normal" window sizes and proportional fonts, but not, as I said before, with proportional fonts and a window set to full 17" screen size.

Nope.

320/480 --> 40/30
640/480 --> 80/30
1280/960 --> 160/60

The system font is 8x16 pixels.

Henk

Most (all?) VDI-bindings I've seen limits the lenght to 80 characters. For some stupid reason these bindings copy the entire string to a global array instead of just using the refered string, you can write your own binding to work around this. Just remember that the VDI expects each character to be 16 bit (word), and not 8 bit.

Lack of imagination and lazyness?

I had a look at the PureC VDI lib. (with TT-Digger!!)
It seems there is no check on the length of the string.
And indeed the parameter areas are fixed length and static.
If the string is more than 256 characters the x and y are overwritten
and if the string is more than about 520, stuff not belonging to
the VDI is overwritten.

A few years ago I rewrote the whole GEMlib because I needed
a reentrant one.

You could split up the string in chunks of 255 char's,
or shall i dig it up and mail you my v_gtext ?
It is a long time ago however, so it will take som time.
But never mind, it's always good to fresh things up.

Henk.

Thats why they all must copy.

Henk.

I nearly said "Noooo!" until I thought better of it and checked my
docs. ;-)

Looks like you've hit the nail on the head. I assumed (long forgot
actually), probably as Jos did, that a pointer to the string was
passed, not the darn thing itself.

>There is nothing against rewriting the library module for v_gtext
>in which you use the existing global array in a own local defined
>aespb with all the other arrays locally declared with the length you want
>them to have.

Hmm, I wonder if using wide strings would help any? Dunno anything
about them, but if every other char is zero then this could be local
intin[] directly. It's a thought. Can't be bothered to investigate it
though!

Hi Jos!

```
JDB>char s[2000+1];
JDB>v_gtext(vdi_handle,pxy[0],pxy[1],s);
```

The problem might be that the VDI itself limits the length of the intin array and thereby the length of the string, so you will have to spilt your string. You can inquire the maximum length supported by the VDI via vq_extnd(1). You will then find the length in workout[15], -1 means no limit

Bye

Joerg

I have the following for sale. I prefer to sell the whole lot as a package.
However, I am willing to sell individual items but the ST must sell as a unit
and not as parts.
Here then for your viewing pleasure is a list of my ST stuff :) :
HARDWARE: $200.00 + $15.00 S&H
4mb 520ST with SC1224 color Monitor, SF314 Floppy Drive, mouse, joystick, 1,
manual, System & language disks, and mouse cleaning ball.

GAMES: $5.00 each + $5.00 S&H
GBA Championship Basketball The Sentry
MetroCross Star Glider
Star Ray Shadow of theBeast II
Guild of Thieves Golden Path
AD&D Hillsfar Gold Runner II
Station Fall Grid Iron
The Black Cauldron Flight Simulator II
Battleship
Pirates of the Barbary Coast

APPLICATIONS: $7.00 each + $5.00 S&H
Habba Check Minder H&D Base Hippo Pixel
Hippo Fonts Cyber Sculpt Art & Film Director
Multi Desk Calamus Outline Art OutBurst 3.3
VIP Professional Flash That's Write
v.3.1G
Atari Logo

BOOKS/PUBLICATIONS:
ST Basic Source Book
A Source Book for Atari Logo

ENTIRE PACKAGE: $250.00 +$20.00 S&H
BTW, I am not leaving the Atari scene.

The printer port is easy, here is some source, warts and all. It was originally bad code posted in here that I fixed up to make work - ignore the commented code, though it might be an interesting documentary on how not to do things.

You could also do it with Bconout from TOS.

```
; Simple code to print a text file

Hi!
I'm just experimenting in ASM (68000 STE) (it's fast, very fast) and
just created some wonderful rasters using the XBIOS 7-call.
I tried the $ff8240-vector, but that wasn't really what I was looking
for.
Anyway I now got the idea to install theese to VBL! I can call
like any program in VBL, but not my rastersource.

Can someone tell me how to make a proper VBL call?

/Jeppe

The portion of the stack that contains x and y is physically
acting as the ptsin array. So the address of that goes directly
to vdipb.
This is written for Pure C on ATARI with a 68K CPU.
It relies on the stack order and stack direction.
Very unportable. :-)
The 0L's (or nil) are for arrays that are not needed, and I dont
want to declare dummy everytime. (Over a 100 vdi functions)

Henk.

P.S.

I said I tested it, but I must confess I did NOT test it with
a string over 2000 bytes. ;-)

This should fit on a 1280 screen, unless the font you use is on avarage
wider than 8 pixels per char. Which VDI do you use?

I have a NOVA vdi version, that has problems with clipping Italic's

Henk.

Shame on me!!! Not wise enough.
The &x can only work for a cdecl lib.
And that was exactly where my lib was meant for.

Jos!! change v_gtext as follows:
Put x & y in a local array and pass that:

```
int pin[2];

pin[0]=x,pin[1]=y;

&x ----> &pin
```

Or forget about it, because this whole thing may not be the the cause
of your problem at all.

The reason why it worked for me, is one of the great riddles
one encounters now and then. I am investigating this anyhow.

Henk.

Are you referring to the real avarage character width? Or does VDI
query vqt_attributes() to get the "avarage" charwidth? With "Chicago",
a proportional GDOS font on my old Atari, I get a width of 12 in both
attributes[8] and attributes[6].

>Which VDI do you use?

I don't know. :)

3099. WEB Site update about the PHENIX 060

Newsgroup: comp.sys.atari.programmer
Date: 1999-04-06 00:00:00 UTC
From: centek <vxp@imaginet.fr>
Message-ID: <7eclo9$9ch$1@news.imaginet.fr>
Source record: 2966

PHENIX 060 - Version R1

We enjoy to announce you an updating of our site, particularly important
in the domain of the PHENIX, our computer.

Here are the last changes :

1 - the 040 version of the PHENIX is abandoned !
The PHOENIX will be therefore a computer basicly provided with the
mythical 68060 at 80MHz, giving 120 MIPS
(040 provides 32 MIPS at 40 MHz!).
Don't be affraid, prices of this 060 have quite changed and we are
therefore in measure to propose a 3 or 4 times
more powerful machine for only 2000 FF more in the full configuration.
This tariff could decrease according to providing of 060 because this
tariff takes account of the worst offer of our suppliers.

2 - LINUX 060 already exists!
Whereas with one or two 040, LINUX would have been just usable, the 060
offers the necessary strength for a comfortable utilization...
Let's not speak of two 060 (240 MIPS).

3 - the DSP56301 works at 100 MHz and its SRAM descends to 12ns. A light
increase of cost for 20 MIPS more(by DSP!).
The addition of a daughter card fitted with 3 DSP at 100 MHz is more
that ever of actuality with recent and new objectives of some of our
customers and partners.
This daughter card will be connected in the PCI slot #3 but it will be
possible to add an identical second of it in the PCI slot #2 (the #1 is
occupied by the graphic card).
Total, 7 DSP at 100 MIPS each (700 MIPS) and 3 DSP connectors offering
each 4 high bi-directional debit serial channels (either 12) of
33Mbits/s for all numeric application ways...

4 - The utilization of SDRAM instead of EDO is essentially reported to
an ulterior version of the PHENIX 060 for cost reasons and time of
development. The SDRAM supports are 4 times cheaper than the EDO
supports (so 60 FFS more) and besides it's necessary to harmonize SDRAM
signals in 3.3 V and signals of the 060 bus in 5V with very speed
buffers (2ns) and costly (60 FF of supplement).
Total, the added 120 FF on the motherboard compensate the gap of tariff
between a 32 Mo SIMM and a 32 Mo SDRAM.
For those that know the 060, it is true that he is compatible with
signals in 3.3V, but our PCI bridge is not: what obliges us to choose 5
V for all components of the 060 local bus.

Until 40 MHz as regards to performances, the SDRAM doesn't offer ANY advantage on the EDO 60ns: accesses are made on all sides in 1 cycle. Between 40 and 80 MHz, the SDRAM makes difference because she always permits BURST accesses in 1 cycle whereas the EDO obliges accesses in 2 cycles (that why the SDRAM imposed itself on computers where processsors reach 66, 80 MHz, and more...

On the PHENIX 060, the only way to take profit from the SDRAM is to pass the 060 in ' FULL SPEED' mode on its bus.
It means that instead of accessing the bus to an half frequency of its execution units (in our case 40 and 80 MHz), the 060 would access the bus to the same frequency than its units, so 80 MHz.
The gain is immediate: with EDO 60 nses, we can access at 80 MHz in BURST in 2 cycles, whereas the SDRAM offers 1 cycle.
It means that the 060 bandwith in RAM is 2 times more important !
Unfortunately, our PCI bridge can't be matched with the 060 beyond 45 MHz (verified timing for CENTEK by manufactory), what obliges us 060 accesses at half speed (HALF-SPEED mode) in bridge (toward the PCI bus).
We have a solution to this problem, but it will be for a little bit later, even though the challenge to wire a 060 in full speed on the SDRAM is exciting enough because that has never been achieved!
Imagine that the 060 in FULL-SPEED mode at 80 MHz is able" to swallow " 320 Mo/s with BURST of 1 cycle 80 MHz!
On Phenix R1, we should be sufficient with BURST 1 cycle 40 MHz, so 160 Mo/s... It is already excellent.

The PHENIX should be produced from JUNE 99.

For all question, we recommand you to visit our site before addressing you to our services, because we are already overflowed by numerous questions...

Thank you for your attention.

Pure C by default uses D0,1,2 and A0,1 for passing parameters.
cdecl forces the more common method of pushing parameters on the stack.
Moreover, because it has been so long ago I forgot that I wrote
this reentrant lib for use by MEGAMAX, not Pure C hence the omission
of the word cdecl.
Pure C correctly moved x from D1 to a temp on the stack, but
didnt do that for y. I had the corresponding warning 'parameter
not used' switched off. (for a otherwise good reason)

> >pin[0]=x,pin[1]=y;
> >&x ----> &pin
>
> Hasty again, I suppose. Should be &x ----> pin.

Allways when I've been hasty I know I'm gonna regret.
But you're skilled enough to correct me. :-)
>
> >Or forget about it, because this whole thing may not be the the cause
> >of your problem at all.
>
> What makes you think so? (I haven't tested it yet.)

You mentioning using 140 byte string.
Pure C can have 256.

Changing setvdipb to cdecl is new. I can do the same for the vdipb
structure as I did for x and y, which saved a couple of long moves.
Compare the assembler parts.

Henk.

Yes. Because the longer the string the more exact the avarage will be.
The more you can be sure whether clipping will take place.

Hi All!

This is a message to announce the opening of my own website! It's rather basic at the moment, but that's only because I'm a novice at HTML! ;-))

I used a program called Web Wizard, published by Cadenza Software for the Atari series of computers. It's a great program that enables the putting together of web pages with background images and sound files, and I think they look pretty good! ;-))

At present I have four main sections: My Homepages, My Atari Page, Atari Downloads, and a Links section; but I plan to expand these further with new sections.

The Downloads page only has two files to download, and they are Demos for the Atari Falcon, but I'm open to suggestions on what else to put on there. I only want to put Atari stuff there, and not commercial stuff neither!! :) The demos are: Sonoluminesenz by Avena, and The Lost Blubb by Lazer. These can be hard to track down on the Web, so that's why I've put them on!!

The Links section I think is pretty good, as well as Atari websites there are more general stuff there too, including a section of Online Newspapers that are around (only UK ones at the mo'!).

Whats the address, I hear you cry? Well its:

http://www.users.zetnet.co.uk/jfhaslam/index.htm

Any comments/suggestions on the site are welcome, just email to the address below!

Cheers!

David Knight (david@ritter.demon.co.uk) wrote:

: Can anyone give me a list of things I need to build a cross compiling
: environment for TOS to run under Linux?

- GCC sources
- Linker and assembler sources
- A working compiler environment
- Atari libs or library sources

You'll also need to be able to generate some library file needed by
GCC to build a cross-GCC. You should be able to generate this file using
GCC on Atari (or on any other m68k machine).

There actually is a working TOS cross-compiler for Linux on some FTP
site somewhere. Try an FTP search...

: Could egcs be used instead of gcc?

Probably, as long as the source-tree contains the cross-compiling stuff...

: what about C/C++ libraries and GEM libraries?

You can either get the binaries from the Atari GCC version or get the
sources and use the cross-compiler to recompile them...

3114. nested interrupts on the m68k

Newsgroup: comp.sys.atari.programmer
Date: 1999-04-12 00:00:00 UTC
From: Tobias Haustein <Haustein@i4.informatik.rwth-aachen.de>
Message-ID: <3711F046.ADD30814@i4.informatik.rwth-aachen.de>
Source record: 2981
Cross-posted to:
comp.sys.m68k,comp.sys.amiga.programmers,comp.sys.amiga.emulations,comp.sys.atari.programmer,comp.arch.embedded

Hi Folks,

i've got a question that is not answered in the motorola databooks. On
the Coldfire processor the first instruction of an interrupt handler is
executed before further interrupts are possible (source: Coldfire Family
Users Manual). I can't find such a passage in the M68000 or M68020
manual.
So, my question is, what happens on a M68000/68010/68020 in the
following
situation:

1. privileg level is zero
2. interrupt request for level 1 occurs
3. cpu saves sr and pc on the stack
4. cpu fetches interrupt vector
5. interrupt request for level 2 occurs!
(a)
6. first instruction of level 1 irq handler is executed
7. cpu saves sr and pc on the stack
8. cpu fetches interrupt vector
...

(b)
6. nothing
7. same as step 7 above...

As i read the ColdFire Manual, branch (a) is correct for this
architecture,
but i expect the M68000 to use branch (b). This is very important, since
my
task scheduler switches tasks in the interrupt. Therefore he needs to
change the status register and the program counter on the stack. This
can't
be done if the interrupt is a nested one.

Any ideas?

Please send answers to this group and to my mail address:
haustein@informatik.rwth-aachen.de

Thank you, ciao,

Tobias

My problems could be solved in two ways: by simply truncating the
string to 255 chars (it turned out that the offending string in the
test phase wasn't 138 chars long, as I said before, but 318), which is
the unsatisfactory easy way out, and by applying your patches, which
is the nicer way, because it allows me to use the maximum line length
of 1000 chars in email messages.

Thanks again!

6.061, ask any archie for an appropriate ftp site.

Oh, and BTW it is a waste of time to get AHDI. I'd advise you to
cantact Uwe Seimet and get a recent version of his HDDRIVER. That
software will be compatible with new hd and exchangeable media drives
(PD, MO, JAZ, ZIP, etc., AFAIK even DVD-RAM).

Greetings all,

Well, as most of the times, the subject line says it all. How do I use EVNT_MULTI to look for either (and if possible both) mouse buttons being pushed?

Thanks in advance,

Joakim

I have the following for items for sale. The only rule is that the Jag, Jag CD, and power pads must go together.
Here then, for your viewing pleasure is my list of Jag stuff. :)

Atari Jaguar with CD and 1 Power Pad, manuals, and boxes.

Cartridge Games:
Alien vs. Predator Cybermorph Fight for Life
Iron Soldier Kasumi Ninja Raiden
Rayman Theme Park Zool2
Trevor McFur in the Crescent Galaxy
Val d'Isere Skiing & Snowboarding

CD Games:
Blue Lightning Myst Vid Grid
BTW, I am not leaving the Atari scene.

You have to set bit 9 of the argument ev_mbclicks, e.g. to wait for both
left and right button set ev_mbmask to 256+2 (wait for max. a
double-click) and ev_mbmask to 3 (set bit 1 and 2).

> Any ideas?

Make sure the scheduler isnï¿½t called from both interrupts. For instance, if
the scheduler is only ever called from the 200 Hz interrupt (in an Atari),
the problem does not arise since the 200 Hz interrupt wonï¿½t fire again
before many instructions from the first firing are executed. Other (higher
level) interrupts do not harm since they will clear the stack again before
execution resumes with your interrupt code.

Cheers Peter

Hello

The zip files of the Flash.bin are correct now! The problem
comes from st-zip 2.6: you cannot add caracters on a file in the
zip. After it, you cannot use st-zip to deflate ...

The beta version is for 128 MB EDO Ram and a better access to the
cardridge port (for Logic 2.5 and logic audio).

Hi All,

I would like to be able to program using C++ on my Atari
but I am having problems finding a complete GCC setup.

Does anybody know where I can find the latest version
of GCC, complete and with install instructions to run
either under plain TOS or a complete MiNT setup.

Thanks,

Ben Hills.

I've had exactly this problem, but couldn't find a solution I liked (I wanted
user programs to be able to run in supervisor mode).

>Make sure the scheduler isn't called from both interrupts. For instance, if

In my case that wasn't possible since I wanted interrupt routines to be able
to for example signal semaphores (it was a real-time kernel, so it would have
been an error to return to the original task if one with a higher priority
had been awakened).

>the scheduler is only ever called from the 200 Hz interrupt (in an Atari),
>the problem does not arise since the 200 Hz interrupt won't fire again
>before many instructions from the first firing are executed. Other (higher

Unfortunately, that doesn't help.

Say for example that a keyboard interrupt occurs while a user program is
running in supervisor mode. If then a 200 Hz interrupt occurs while the
processor is still running the keyboard code, there's no way to know that
the current processor registers are not those of the user program.
So, the timer interrupt code can't save the process state and therefore not
reschedule!

If the first instruction of the keyboard interrupt had been guaranteed to
be executed before the timer interrupt was allowed, it would have been
possible to avoid the problem.
You wouldn't even have to disable all interrupts in that first instruction.
It would be enough to somehow mark that an interrupt had been entered, since
you can then make sure that only the very first of the nested interrupt does
any actual rescheduling (this requires that the kernel deals with all
interrupts, though).
In my case, I did what I describe above, but I'm aware that it won't work if
another interrupt can indeed occur before the first instruction of the
previous one is executed (d0-d7/a0-a7 will still be the ones from the running

process, but the program counter and status register won't be correct) and
the m68k is supposed to behave that way, unfortunately.
(This kernel is only used in a basic microcomputer/realtime course, so you
don't have to worry about running into anything that's controlled by it.
(The problem is also clearly documented.) ;-)

If you don't allow user processes to run in supervisor mode, there's no need
for an explicit mark when entering an interrupt, since you can just inspect
the status register on the stack to decide if it's a nested interrupt.
(That will most likely require that other exceptions (Trap etc) are prepared
to do rescheduling too.)

I'd very much like to know if there's a way around this problem.

>level) interrupts do not harm since they will clear the stack again before
>execution resumes with your interrupt code.

That's of course true, though.

3137. Re: nested interrupts on the m68k

Newsgroup: comp.sys.atari.programmer
Date: 1999-04-14 00:00:00 UTC
From: David Brown <david@westcontrol.com>
Message-ID: <7f1v0u$10h$1@thelma.netpower.no>
Source record: 2855
Cross-posted to:
comp.sys.m68k,comp.sys.amiga.programmers,comp.sys.amiga.emulations,comp.sys.atari.programmer,comp.arch.embedded

If you normally run with all interrupt levels enabled, then you can look at the stacked copy of the interrupt mask. The mask is part of the status register which is stacked during interrupt handling, so it is immune to multiple-interrupt problems. If the mask is not zero, you know you are in a nested interrupt handler and should not call the scheduler.

On occasions you may want to disable some or all interrupt levels within the user task, for timing critical sections, or to guarentee atomicity. In this case, you do not want the interrupt to call the scheduler even though the interrupts are not nested. The system described above will work in this case too.

David Brown

Thanks a lot Jo!

This problem has been bugging me for some time now.
I really appreciate the help, since I needed this feature
badly for a lot of things.

Regards,

Joakim

Hi Peter!

PR>Other (higher level) interrupts do not harm since they will clear the
PR>stack again before execution resumes with your interrupt code.
I think the problems are caused by the lower priority interrupts, because the
scheduler saves their context when they get interrupted by the scheduler

Bye

Amazingly, these are the rare cases in which the use of hex
really makes sense ;-)

Cheers.
Henk.

From: goev@telenor.com
Message-ID: <3715A320.55053B40@online.no>
Source record: 2859

Hi!

I'm planning to make a device drive for Magic, but I haven't got much experience with making one, so I need some help! The device will hopefully be compatible with the serial-devices on MiNT, so that I can use the Palm Pilot link-software under MagiC too.
I've tried to compile the dev-lpt1 from Andreas Kromke, but I seem to miss some files (tosref.h and ncstart.o, or something).
So, I'm looking for sources, docs and specs on how to make a MagiC device driver.
Any help would be greatly appreciated!

Thanks!

Best regards
Geir ï¿½yvind Vï¿½lidalo

> Just got this article in the since long dead comp.sys.atari.announce
> group. Looks like someone is able to moderate it?

Yes indeed!

After a lengthy hiatus, the newsgroup comp.sys.atari.announce is
back. I have taken over as moderator, and just approved a posting, the
group's first in years.

I plan to update the group's charter, and will work with the Atari/Usenet
community to make the newsgroup as useful as it can be. c.s.a.a will be a
low-volume newsgroup offering news about Atari software, hardware, Web
sites, and other information relevant to Atari users. Articles may be
related to Atari 8-bit, ST, Portfolio, and PC clones.

I would appreciate your help in getting the word out about
comp.sys.atari.announce -- after such a long lull, I'm sure many
Atari-loving newsgroup readers have forgotten about this newsgroup. Of
course, I also invite folks to post any Atari-related announcements to the
group.

If you've written any STOS programs, they MUST be your OWN material, why not send them to me. If you want them to be licenseware etc... I'm willing to distribute them.

Also if you know anyone that had licenseware distributed by L.A.P.D. then please get in touch as I have taken over the software and I'll need your details etc...

Together we can make it happen!

The all-time classic is ConNect. It used to be shareware, but the
authors have now released the utility that creates the user-key.

The status word on the stack can be checked to determine if an interrupt
handler was interrupted. In that case, with some stack manipulation, the
scheduler can let the interrupted code complete itï¿½s task, and have the RTE
jump to the scheduler. Itï¿½s a bit tricky, but feasible.

Cheers Peter

Hi Peter!

PR>The status word on the stack can be checked to determine if an
PR>interrupt handler was interrupted. In that case, with some stack
PR>manipulation, the scheduler can let the interrupted code complete itï¿½s
PR>task, and have the RTE jump to the scheduler. Itï¿½s a bit tricky, but
PR>feasible.
There's one small problem with that:
It's not forbidden to use the stack while in an interrupt. And if the
interrupt routine can place some data on the stack you have only one chance
to to find the SR: it's at a fixed position. But you cannot asure that unless
you forbidd task switches while in supervisor mode...
Or did I miss something?

Bye

Hallo everybody.

When the Pure C shell runs Pasm, its messages are communicated to the
shell and displayed in the message window.

Does anybody happen to know how this is done?
There must be some interface.

I write my own shell and compiler for my own programming language,
but I use Pasm & Plink to produce binaries. I want to do the same
as Pure C: recieve the Bios output from Pasm & Plink and put them
in my own journal.

Henk.

The newest GCC there is 2.8.1, also comes with dome docs in HYP format
(in German).

3164. GEM gets GPL'd

Newsgroup: comp.sys.atari.programmer

Here's an interesting tidbit I ran across this evening...

http://www.devili.iki.fi/cpm/gemworld.html

Caldera has released the source code to GEM (but only Intel at this point, it seems) under the GPL (meaning--it's free!). Atari ST programmers still may want to check this out, seeing as they have an Atari developer's kit on there as well as the source code to many of the GEM productivity applications such as GEM Graph, GEM Write and GEM Desktop Publisher.

Are you sure that there are sources for the applications? The ones I
tried contained binaries only. Anyway, the gem sources are welcome. I
will try to compile the desktop as well as the resource construction
set under Osis.

Easy question,

My screen's narrower than the screenmode i'm using. How do I centre it?

e.g. I'm opening a 256 pixel wide screen on a 320 wide screenmode.

I'm guessing I can get the width from the displayinfo database, but I can't find the values I need.

Hi!

Are you planning to emulate the DSP as well? (If you don't it will be a
pretty useless emulator as allmost all Falcon programs use it :-)

Yup, it's good, but because it completely ignores GEM it does not work on
my Falcon or TT, and not even the Mega ST with Lacescan enabled.

I use Freeze Dried Terminal on my TT. It seems to work well in the TT medium
resolution screen. I also use it using the Nova VME Plus graphics card in
256 colors although some of it's features don't work.

Freeze Dried Terminal works well in TT low (16 colors). I haven't tried it
all that much in the TT medium but imagine the same problems as with the 256
color mode using the Nova card.

Sorry about the mistake in my previous post; I hardly ever use the standard
TT screen resolutions.

TT low has 256 colors (8 bits). It's TT medium (and ST low) that has 16
colors.

>
>Chris

I did manage to do it once using MakeDisk.Exe running under Soft_PC on a TT,
but it was not very pleasant to do it that way.

Another tool, which is for TOS use, that claims to do it is the JAY_MSA
packer/unpacker, which is intended to support '.ST' files as an alternative
for the '.MSA' format. Unfortunately no version I've tried could handle
the '.ST' files I tested, so possibly the format has variations unknown
to 'Jay'.

But there is another tool that does the job properly under TOS, and that
is ST2DISK, which is a program dedicated to this particular need. It can
not be used to create '.ST' files, but only to unpack them to disks. You
should be able to find it on one of the major PACIFIST-related pages.
The program needs to be registered for unlimited use, but it is costfree
to register, and even unregistered it can create complete disks. It just
takes a bit longer then (some 'nag' dialogs).

Even so, don't hesitate to go on with your project if it interests you.
Perhaps yours will eventually have '.ST' creation ability too...?

Can't help with an ST version I'm afraid but the Acorn BBC Micro
computers had Basic source for this program. "BBC Basic" is an
absolute doddle to understand and very well structured btw - porting
it to Pascal wouldn't take much longer than typing it in! ;-)

This must be ten years old if it's a day!!! If you don't know too much C or the names referred to by the macros I can have the compiler produce commented asm ...

```
#define DEF_VARS
#include <sysvars.h>
#include <cpu.h>
#include "misc.h"

bool
_mi_vbl_slot(newvbl,install)
void (*newvbl)();
bool install;
/*[ bool _mi_vbl_slot(newvbl,install)
void (*newvbl)();
bool install;

Installs or removes a handler from the VBL queue. 'install' should be
true
to install the user handler 'newvbl' which will be installed in the
first
free slot located. true will be returned for success and false for
failure.

When 'install' is false then 'newvbl' is searched for in the VBL
queue and
removed if it located, returning true for success and false for
failure.

The routine saves the VBL semaphore and then disables VBL processing
while it
searches and restores the original state before returning. The
current
```

```
processor state is saved and supervisor state obtained if neccessary,
the
previous state being re-instated before returning.

False denotes a full VBL queue for installation and that the handler
has
already been removed for removal.
]*/
{UWORD old_vblsem;
bool old_state =cp_procstate();
int i;
ptr *addr =(install ? NULL : newvbl);

if (!old_state) cp_superstate();
old_vblsem = *SYS_VBLSEM;
for (
i = 0;
i < *SYS_NVBLS;
i += 1
) {

if ((*SYS_VBLQUEUE)[i] == (ulong)addr) {
if (install) (*SYS_VBLQUEUE)[i] = (ulong)newvbl;
else (*SYS_VBLQUEUE)[i] = (ulong)NULL;

*SYS_VBLSEM = old_vblsem;
if (!old_state) cp_userstate();
return true;
}
}

*SYS_VBLSEM = old_vblsem;
if (!old_state) cp_userstate();
return false;
}

I guess ((320 - 256) / 2) isn't the answer you're after?

>I'm guessing I can get the width from the displayinfo database, but I can't
>find the values I need.

Depends what interface you are using. For the AES you'd enquire
WH_DESKTOP via wind_get(). The VDI has it in the "work out" array.
Offhand I haven't a clue where TOS gets it from (probably the LineA).

Yes, it looks just like all those near unusable demo versions that some
people like to release. I don't see why they do that, as such versions
are likely to make users _less_ inclined to register, since they get an
unpleasant memory associated with that software.

But in the case of ST2DISK, the program really can do all the things that
the registered version can. It is just a bit awkward to do it unregistered.

>My program to restore .ST files to disc is 100% working :-) I'll be adding

I'm willing, but can't test the .ST files with emulators, since I do not
use PCs.

Actually, I figured out a way a long time ago to get FzT to work great in Falcon 16 color mode.
As long as you are running NVDI (even Warp 9). For some reason without screen acceleration, the colors just won't work right at all. Anyway:

*First, you have to reverse black and white in the pallette because FzT mixes these up internally. Just use whatever CPX you use to adjust this. I simply created a NEWDESK.INF file called FZT.INF (which had these colors) and with X-Boot used this .INF file whenever I booted up to use FzT.

*Then, I use the serial patch program called FAST_SER.PRG. It allows remapping the port so that when you select 19,200 in FzT, you actually get 57,600. So your 28.8 or 56k modem will work as it should.

*And make sure you use a third party file selector, as the normal Falcon's (TOS 4) selector will create some redraw problems.

*Make sure your Falcon is in 16 color mode (not 256 or TC as this will create a few errors and problems).

*Now as far as working under MagiC? It does that too. Just make sure you're in 16 color mode, and set it up for single tasking.

Is this a PC or Atari program? I've already seen a PC prog that'll do this,
but I'm after an Atari executable that'll restore .ST images to floppies.

I'll help test it if this is the case.

My prog is a Atari PRG, it currently has the option to restore .ST files
back to floppy. I have tested it out lastnight with a lot of .ST files and
it seams to work fine. I'm currently adding a option to read a disc into a
.ST image, though this parts only have wrote so far but it should be working
later on tonight. I'm just adding a basic shell to it at the moment. If
you can help by testing it out to see how well you get on with it then that
would be great :)

From my 68000 book,
"suppose that the current interrupt mask is level 3. If a level 5
intrerupt occurs, it is
processed and the interrupt mask set to level 5. If during the processing
of this
interrupt, a level 4 interrupt is requested, it is made pending, even though
it has
a higher priority than the original interrupt mask.
When the level 5 interrupt has been processed, a return from exception is
made
and the former processor status word restored. As the old interrupt mask
was 3,
the pending interrupt of level 4 is then serviced."

hope this helps.

Mark

```
forgot to answer you question...
from my previous message, an
answer would be

interrupt request for level 1 occurs
interrupt mask set to 1
cpu saves sr and pc on the stack
cpu fetches interrupt vector
interrupt request for level 2 occurs
interrupt mask set to 2
int 2 service routine executed
int 2 finishes
int mask set back to 1
continue int 1 service routine
```

>Which emulator am I best getting for programming?

The best of the freeware and shareware ones that I've tried is
definitely TOSBox. I'm not sure about WinSTon or PacifiST, since I don't
use them very much.

As for the commercial ones, Gemulator is supposed to be pretty good at
emulation, and if MagicPC is as good as the demo, it's a very good one.
It certainly appears more compatible with a few programs than Magic
v5.11 is.

The best thing to do would be to D/L the TOSBox, WinSTon and PacifiST
v0.48, since v0.49 appears to be rather unstable on my system, and try
them out doing whatever you're going to be doing on it.

You know something, I really would like to get back in the Atari/TOS scene so "yeah" I love to see something like that!

I have a few questions, one being will the DSP be emulated or could a DSP card be used? With the way they make the PC's now, I wouldn't be surprised if the whole thing is done on software :)

Of course I should warn that you may get some opposition from "purists" who hate any emulation on on Atari/Hades/Milian machine. But then again, you can just ignore them ;)

Anyways I hope you succeed in this endevior. Maybe I can get back to my own project of running older ST programs under Magic/MINT :)

Hello Joakim,

I suppose you must "add" the frequences of your notes. The note "a" has the frequence 440 Hz, the octave above it is 880 Hz. The Interval between them is devided into 12 parts for multiplication. So you can obtain each tone: count the "half-tones" between "a" and the given tone and calculate 440 * 2^(n/12)!

To add the frequences you must use the sinus and cosinus rules for sin(a)+sin(b)=....! This function is to be played for the time, where de different tones should be played. For a ST you can prepare e String for the sound chip and use dosound(), for STE and upwards you can use the DMA-sound... ;-)

Chris:
|> My prog is a Atari PRG, it currently has the option to restore .ST files
|> back to floppy. I have tested it out lastnight with a lot of .ST files and
|> it seams to work fine. I'm currently adding a option to read a disc into a
|> .ST image, though this parts only have wrote so far but it should be working
|> later on tonight. I'm just adding a basic shell to it at the moment. If
|> you can help by testing it out to see how well you get on with it then that
|> would be great :)

Try it out with the Elvira ST files. The MSA2ST converter (PC prog)
fails to produce the correct .MSA file for disk D.
Fetch the *five* ST files from:
ftp -v -n
open atari.d-n-a.net 8021
user ftp chris@
cd automation
bin
get A_455_A.zip
get A_455_B.zip
get A_455_C.zip
get A_455_D.zip
get A_455_E.zip
bye
and run the Elvira intro until disk D is requested and accepted.

That's my way to produce ST disks: convert .ST files to .MSA with
MSA2ST -m FOO.ST on my PC, then copy FOO.MSA on a 1.44MB floppy and
unpack it on my STE. (But NOT with JayMSA, it doesn't work at all.)
You can find MSA2ST on the PaCifiST home page. Maybe the author
provides the source code?

Oh, BTW, I mostly use my PC to run PaCifiST or load digitized tape data
into my ZX Spectrum. ;)

Regards, Jens.

Mt. View Biomedical Startup 70-80k plus stock
C programmer
in this role you will need to be bright, enthusiastic
and a flexible college graduate, with some solid
programming experience in C/Unix. C/C++ on a PC would
be fine, but a highly GUI focused Visual type
developer would probably struggle with the
requirements. The computing skills may have been
acquired on a formal computing degree course, but
equally they may have been acquired in the course of
other study as a necessary tool. Must have had at
least a year's experience programming to other
peoples' requirements, although this would not
necessarily be in a commercial environment. They
should feel comfortable working with the scientific
members of staff, developing software requirements in
the context of a growing understanding of the
business, technology and science of the company. They
should be comfortable working on their own or in
larger project teams.
The main role will be to elucidate software
requirements within the scope of the various other
systems being developed, build prototypes, organize
user testing and acceptance, deliver finished software
in a timely fashion with documentation as required,
and provide support and further development as
necessary. The main languages will be C running under
unix and SQL, but there will be many requirements to
utilize other languages and techniques in the highly
integrated & automated systems the company will be
building. There will be opportunities to do data
modeling.
Technical Skill Set/Years Of Experience - (Required)
(Hardware, Software, Database, Communications...)
1. 1+yr. Exper. Programming UNIX in C to
specifications provided by others.
2. Experience In SQL
3. BS degree but programming skills may be acquired in
class or "on the job". Additional Technical Skills -
(Plus)
1. Exposure to any of the following will be an asset:

CGI programming/SQL/perl
2. Desire to be a "team member" in addition to a being an individual contributor.
3. Confortable working with scientific members of staff.

SAN FRANCISCO 80K-90K PLUS STOCK

As Senior Web Applications Programmer for this Company, you will be developing web-based programs using a combination of the following skills: COM, DCOM, Java, JDBC, ADO, Active Server Pages (ASP), JHTML, IIS 4.0 or Java Web Server. You must have at least one of the following in distributed architectures: DCOM/Enterprise, Java/CORBA. Experience in writing professionally-crafted requirements analysis and design documents is also a must.

Minimum qualifications include:
-- BS degree in CS, EE or MIS;
-- Strong written and verbal communication skills;
-- Strong team attitude with a focus on details and client satisfaction; and
-- 4-10 years professional development experience.

As a Web Applications Programmer for this Company, you will be developing web-based programs using a combination of the following skills: COM, DCOM, Java, JDBC, ADO, Active Server Pages (ASP), JHTML, IIS 4.0 or Java Web Server. It is essential that you possess strong written and verbal communication skills, as well as a strong team attitude with a focus on details and client satisfaction. A BS degree in CS, EE or MIS is required, as are 2-5 years of professional development experience. You must know how to author stored procedures using PL/S and/or Transact SQL. Other requirements include 1+ years of solid internet application development experience, and familiarity with Oracle and/or MS SQL Server.

REDWOOD CITY 80K-90K PLUS STOCK

Join a company that is on the cutting edge of e-commerce. This is an opportunity to change the way millions of people do business. Company currently has 50 employees and is experiencing explosive growth. Compensation will includes a very attractive stock option plan.

In the Web Developer / Software Engineer position, your duties will include coding modules

according to customer specifications, testing and documenting code, and designing modules when required. You must have at least 2 years web development experience using Perl, CGI, HTTP, HTML, C, SQL and Windows.
Familiarity with graphics packages--
Photoshop, Illustrator, Debabelizer, HTML--is desired. You should have a portfolio ready to demonstrate your work on different sites.

Please apply or call today for more details!

Mt. View Biomedical compnay 70k plus stock
Unix Adminsistrator
If you are bright, enthusiastic and flexible graduate, and are prepared to work on a great variety of tasks associated with the development and maintenance of the company's various computer systems. The main tasks will be system administration for (initially) all company systems, which will include Sun unix machines of various scales, the development and production data servers, and the company file&print server. As part of this they will have to develop and maintain effective data backup and recovery systems. They will be responsible for provision and support of desktop computing, both PCs and X terminals (or equivalent), printers, e-mail, software, etc..
REQUIREMENTS:
1. primary skills will be based around unix system administration and operation of LANs and internet connections.
2. at least one years' experience as the key person running some sort of unix installation.
Exposure to any of the following will be an asset:
3. Intranets/Sybase/Oracle/Novell/network design/network storage devices.
4. BS Degree (minimum).

As the company grows, this post will evolve, and will become more specialised, either technically or managerially, depending on the skills and/or career development requirements of the incumbent.

San Francisco 80-90k plus stock
DBA Programmer
As a Database Administrator for this Company, you will assist with their client project as the DBA for their client server farm. You will be immediately responsible for helping to make the site as stable as possible by auditing, creating new, modifying existing, and documenting all SQL environments, backup

procedures, and monitors. You will ensure that all data transfers are successfully executed and monitored, as well as develop and document contingency plans for these transfers. You will also assist in properly training and transitioning these responsibilities to a DBA to be determined by their client. Once stable, you will then assist in creating a "Best Practice" Document for use on all other Site Server Membership deployments. You will then be staffed on another Site Server Project or leveraged on database-intensive projects within the Business Systems Practice.

REQUIREMENTS:
--MS SQL Server DBA with at least two years experience as a DBA.
--Knowledge of backup, clustering, and performance tuning.
--Knowledge of MS Site Server and the Membership Directory preferred
--Experience with other databases, specifically Oracle.
--Certifications with at least one technology, but as no substitute for experience.

Hey,

I've recently begun programming my old ST as a
fun side project and i have a small problem.

I run in medium resolution and my program switches to
low resolution, when i come back to medium resolution
it looks like the screen address is off by a plane.
(Eg i see the screen in red/green...)
I know that this description is quite fague, but maybe
somebody knows what i mean...

Does anybody know what's wrong and what i can do to
stop this from happening ?
(It might be usefull to know that I use devpac on an
STe...)

Thanks in advance, Alex...

Yep, it is vague. Fortunately there ain't too many causes! ;-)

>Does anybody know what's wrong

The display chip doesn't care what mode you're in. It just so happens
all three ST modes use 32K of memory. When you change from one mode to
another the chip simply translates the information in that space
differently, hence the wierd display.

>and what i can do to
>stop this from happening ?

Depends on what "owned" the original display - but the best way round
it is not to corrupt it in the first place. When you enter low rez
change the display address to another block of memory. Doesn't matter
where this 32K is, *provided* it is aligned on a 256 byte boundary.
Just restore the original address when you revert to medium rez.
Sumfink like this ...

```
old_log = Logbase()
old_phy = Physbase()
old_rez = Getrez()
d0 = Malloc(32 * 1024 + 256) //or use static 32K+256 block
if (d0 zero) then rts "not enough memory"
cur_base = d0
d0 = d0 + 256
d0 = d0 $ffffff00
Setscreen(d0,d0,lowrez);
jsr YeOldeLowRezProgram
Setscreen(old_log,old_phy,old_rez)
Mfree(cur_base)
```

```
rts

As Brian O'Donnell suggested to me i'm including my code here, it's quite long
sorry for that one....

Maybe there's an error in there someware, i must confess that i stole
almost all the code in the routine 'start' from an example.
(and my ST knwoledge is too limitted to really understand it :> )

the routine '_main' that's not included 'draws' to _w_screen and
calls '_swap_screen' until the spacebar is pressed...

Thanks in advance, again,
Alex...

```

I AM modifying the content of the original screen buffer,
but i don't think thats the problem (eg. the GEM windows ARE redrawn).
But it sometimes (75% of the times it workls correctly) looks just
like if you'd copy an image but skipping the first word so all
words are one word too early in the screen buffer...

Hmm, this explanation doesnt help either does it ? ;>

Anyways, i've posted my code in this newsgroup too,
maybe that somebody can find an error in it ?

Alex...

```
Also try a v_sync before you switch rez.

On the 256 byte screen boundary I tend to do this:

move.l #screen,d0
clr.b d0

ds.b 256
screen:
ds.b 32000

the code always ensures the new screen address is on a 256 byte boundary.
Nice and simple.

Agenda for the May 19th, 1999 Toronto Atari Federation meeting:

First, it's time once again for the annual TAF Executive Elections! If you like what the club is doing, or want to see a change in how it's being run, then by all means come in and let your voice be heard! This is the executive you'll be bringing in to the next millenium....

Then, we'll be looking at how to improve the efficiency of your PC computer - by installing an Atari emulator and running your favorite ST applications on it! We'll be looking at GEMulator, TOSBox, PacifiST and other popular ST emulators, running on both a PC laptop and on our PHOENIX editor's PC tower! Learn about how well the various emulators run, the advantages, the pitfalls, the issues on emulation - and what does and doesn't run. Needless to say, this seminar will also allow you to run your programs well into the millenium as well.

It'll be an exciting night, to say the least. See you there!

TORONTO ATARI FEDERATION meetings are held on the third Wednsday of the month from Sept-June in the "Gold Room" of the North York Memorial Hall located in the lower or concourse level of the North York City Centre Library Building at 5110 Yonge Street (next to Mel Lastman Square) at Parkholme Avenue. Those coming by public transport can take the TTC Yonge Line north to North York Centre Station. $2 for non-members. Dues are $25 per year, and includes a subscription to the newsletter PHOENIX. Membership in TAF IS Atari support!

From: "David A. Elliott" <delliott@nac.net>
Message-ID: <cmp03.69$kn3.2561@nntp1>
Source record: 2827
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.8bit,comp.sys.atari.advocacy

Hello all,
I have made the plunge into my newly acquired 800XL and want to learn to program on it and I have a VERY embarrassing question.
How to I save and load from my 1050 floppy drive?
I have a book on game programming that came with a disk. I typed CLOAD and it started to load, but then I realized that there are most likely more than 1 program on the disk. The disk isn't labeled so I need to know what is on it. How do I find out the names of the files on the disk and how do I load those files (I assume CLOAD then the name of the program)? I assume saving a program is similar.
I am too used to DOS and Windows...
Please e-mail me at delliott@nac.net and don't be too hard on me.
Thanks,
David
PS I'm sure the same holds true for my 410 program recorder too...

3211. MPEG 1&2 Video decoder

Newsgroup: comp.sys.atari.programmer
Date: 1999-05-18 00:00:00 UTC
From: LE COAT Francois <lecoat@ief.u-psud.fr>
Message-ID: <37413805.B98C4FAE@ief.u-psud.fr>
Source record: 2828
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer,comp.sys.atari.st.tech

Hi,

I have adapted MPEG2DECODE, a bitstream ISO video 1&2 decoder, to all
ATARI platforms running more or equal to 256 colors. The decoder's
binaries are available at http://eureka.atari.org/mpeg2dec.zip
It works now nicely. But, I was wondering whether someone would be
able to extend the C source code, so that it could decode MPEG
audio included in the stream. I've no idea of what to do, but maybe
someone would do it. The sources have been succesfully compiled
with PURE C 1.1 and GCC 2.8.1 in 16 and 32 bits int modes. There's
more and more MPEG sequence on CDROMs nowadays, and decode them
without the sound is a bit frustrating. Of course there's a need
of CPU power to decode MPEG, but I have an HADES 060, and powerfull
ATARI computers now apear. I think that to decode both Video and Audio,
Audio should be preprocessed, and be played while decoding Video.
I've no idea of MPEG Audio formats, either than the audio stream
included in video, but, my decoder decodes MPEG Audio/Video 1&2
streams without the sound for the moment. If anyone has the ability
to adapt my C sources, I would be glad to send them. Maybe
I could take advantage of MPEG Audio decoders that are available
on ATARI.
Thanks for cooperating ...

Regards,
Bye for now,

I'm not an expert with machine code but the code you've "liberated"
<g> seems to be going at it very low level.

Firstly all the _restore_res routine appears to do is simply restore
the old resolution. Until such time as something "clears" or otherwise
completely redraws that 32K of screen ram then it is going to look
wierd.

Secondly, there are lots of registers associated with the video. I
personally know nothing about them but I'd be most surprised if the
system lets you get away with changing them when you feel like it.

This is where I think the problem lies: simply that 25% of the time
the change is made at the wrong time and something isn't synchronised.
Might even be that no rez change even takes place!

The _swap_screens routine does appear to be toggling between two
screen displays. This, coupled with the fact the code totally hijacks
the VBL interrupt and runs entirely in supervisor mode indicates (imo)
this code is targetted for a "shoot-em-up" kind of game, where fast
frame rates are the order of the day. All other considerations come
second to this, thus these kinds of games rarely exit cleanly.

>Hmm, this explanation doesnt help either does it ? ;>

oo, I dunno. ;=)

>Anyways, i've posted my code in this newsgroup too,
>maybe that somebody can find an error in it ?

Like I've said, I could be wrong. I'm not expert enough with machine
code or direct hardware access to tell. I do think it is the wrong
kind of code though. Standard operating system calls can be used for
initialisation and termination.

Best go look at the code now ... ;-)

... my money goes on that #-1 value I've mentioned for Setscrn().

> addq.l #6,sp
> move.l d0,old_ssp Store old SSP
```

The ST usually runs with the processor in "usermode". It only enters superstate inside the operating system (ie in a trap / interrupt etc). This feature is common to all 68000 processors but the above call is specific to the ST - there is no way you can get into superstate unless the system provides a mechanism to do it.

Some memory locations are inaccessible in userstate (like hardware) and (iirc) the 1st 1Kb of ram. The above call is called "Super()". It allows a userstate program to enter superstate, or to revert back from superstate to the normal userstate. The processor maintains two hardware stacks: one is used in superstate, the other in userstate. Because when one is active the other must be inactive, both are known as "a7" or "sp" - whatever it is your assembler uses. ie the stack in use at any one time can only be known if you know what mode the processor is in at the time.

Essentially what happens above is the system enters superstate and returns the userstate stack. This must be preserved and restored (usually pretty soon but games tend not to) later with another call to Super using this d0 value as its argument.

```
> move.w #3,-(sp) Logbase to find the screen
> trap #14
> addq.l #2,sp
> move.l d0,_d_screen Store the currently displayed screen
> move.l d0,old_screen
```

Logbase() is the address where the system scribbles its graphics. Physbase() is where the video displays its graphics. Normally both addresses are the same but a game usually needs to change them. Typically it'll have two Logbase screens and the Physbase will toggle constantly between them during the flyback portion of the video chip whilst the game draws on the one that isn't currently being displayed. ie flicker free graphics.

```
> move.l #w_screen,d0 Create a offscreen buffer
> addi.l #256,d0 ensure it's on a 256 byte boundry
> andi.l #$ffffff00,d0
```

```
> move.l d0,_w_screen
>
> move.w sr,old_sr Save status register
```

this is the superstack, or superstate stack pointer cos we're still in
supervisor mode (which is where we stay).

```
>* call the main program
> bsr _set_low_res
> bsr _main
> bsr _restore_res
>
>* clean up
> move.w old_sr,sr Restore status register
> move.l old_ssp,sp Restore stack
```

this is where my lack of asm knowledge lets me down. It's dumping that
saved userstack right over the top of the superstack to revert back to
"usermode" ... or is it? This may be perfectly legal but why can it
not call Super(old_ssp) as per docs?

```
> move.w #-1,-(sp) Restore the screen
> move.l old_screen,-(sp)
> move.l old_screen,-(sp)
> move.w #5,-(sp)
> trap #14
> lea 12(sp),sp
```

eek! I'm lost. That #-1 argument doesn't make any sense. Either
there's something I don't know or it is definately a bug. That should
be the screen mode, -1 values in OS calls are typically used to mean
"don't change". I would have expected the initialisation code to have
issued a Getrez() earlier then pass the saved value from that as the
arg here. Someone else is gonna have to explain this one! Oth iirc "1"
is the value for medium rez so it could just be a typo.

```
> clr.w -(sp) Exit back to TOS
> trap #1
>
>
>*************************************************************************
>* Resolution switching code...
```

oo heavy [in a Homer type voice] ;-)

Not really needed if you only want to draw on the same
Logbase/Physbase screen ...

```

The commands in ATARI BASIC is as follows:

LOAD "D:FILENAME.BAS" - D is for disk drive, if you have more than one
disk drive then you can use LOAD "D2:FILENAME.BAS" this will load the
program FILENAME.BAS from the second disk drive.

To save a file it is pretty much the same SAVE "D:FILENAME.BAS" etc..

You can also load then run a file by RUN "D:FILENAME.BAS"

By typing DOS you can get a menu of DOS options.

Filenames have the same rules as MS-DOS on a PC, including wildcards.

Disk directory can only be seen by going into the DOS menu and
selecting A.

Hope this answers you questions.

Why not do two processes, one for midi and one for the AES part.

There are no embarrassing questions. We all had to start somewhere.

Firstly. is DOS loaded???
To load dos, turn on drive, instert the disk, close door then turn on
the computer.
you should hear a series of beeps comming from the speaker thenthe
ready prompt.
Anything else like errors or no loading at all means something is not
working.

From basic, enter DOS for the dos menu.
From dos, B to enter cartridge (basic).
From basic LOAD"D:program.ext. where program.ext is the name of the
program you wish to load.
SAVE"D:program.ext saves your program.
LIST"D:program.ext Lists the program to disk.
ENTER"D:program.ext Enters a listed program from disk.

The last two instructions do have a use but are not mandtory.
They are used to clear out the vairable table of unused vairables
because Atari basic can only have 128 vairables.

CLOAD and CSAVE are used for the 410 only.

James.

Yes, in your main GEM app you fork(). Then in the child simply wait for
midi bytes using Bconin(3). Under MiNT, the child will be blocked until a
midi byte is available.
When you get a byte you can send it to the GEM app using appl_write().

(it will be a little slow. I suggest you to collect a certain amount of midi
bytes before sending them)

Vincent

> still be able to wait for other instructions.

There's basically three ways to do this:

1. Use a very short timer in your evnt_multi()-loop, and poll the MIDI-port using either Xbios or GEMDOS at every time-out. This is the only method that works on all TOS/AES-versions and -alternatives, but thanks to the large overhead in evnt_multi it's not very fast. It's a very common method though.

2. If the OS is capable of it, you can run the MIDI-part in a separate process. Do a fork in the main application, initialize a new application in the forked process (so you can use appl_write) and wait for incoming data (using e.g. Bconin) on the MIDI-port. When something arrives just send it to the main application with appl_write.

The downside of this is that it's not trivial to use threads this way when you're calling the AES (basically you'll have to use some custom AES/VDI-bindings), and it will only work with MiNT or the very latest version of MagiC (6.2 IIRC).

3. Use AES-threads in MagiC. This is probably the most elegant solution, but it will only work with MagiC (from version 5 I believe, perhaps version 4). They don't differ from MiNT-threads a lot, but they're more efficient. This doesn't mean much in real life though, unless you create threads very often.

It's a pity that GEMDOS can't trigger any events in the AES, this makes GEM-programming a lot harder than necessary. XaAES circumvents this, as it passes events in a pipe which applications can listen to. This means that you can wait for both AES-events and regular IO with a simple select().

Yes I figured it wouldn�t be all that efficient. I will consider this
though. It would be great if I could get it to work on all TOS/AES out
there.

This does indeed sound nice, but (as you might know by now :) I do my
programming in GFA, and has no knowledge about calling MiNT from it.
Most of the DOC's on MiNT (and programming over all) is written with
C(++) in mind, and it is sometimes a bit hard to understand if you (like
me) are no proffesional programmer. ;)

Can somebody point me in the right direction to learn about MiNT calls
(from GFA-basic point of view)?

I would appreciate this *very* much!

Recent versions of MagiC can also do this, so it's not MiNT-specific. But
OTOH, I don't know if it's even possible to write reentrant code with
GFA...

> Can somebody point me in the right direction to learn about MiNT calls

Katherine Ellis is the only MiNT-programmer I know of that use GFA.

Without DOS you can't read a disk, but most pre-recorded disks have some
sort of DOS. First you turn on the drive and insert the disk, then turn on
the computer. If it says "BOOT ERROR", you need to get a DOS disk.

Just a thought...

You could write a DA to handle the midi side. This could then message
your main app (or anybody else's).

>Can somebody point me in the right direction to learn about MiNT calls
>(from GFA-basic point of view)?

>
>I would appreciate this *very* much!

I don't think it is wonderously difficult. I don't know anything about GFA myself. However, Lonny Purcell got a GFA prog calling an object library that I wrote in C without too much bother. Seems it can generate C friendly calls somehow, which is the key.

There's such a thing as a "standard C call". Take the time to understand this and life will be a lot easier! ;-)

(some C programmers could take note as well - this is the basis of upgrading your compiler to support new OS calls)

A standard C call is where C passes its arguments on the stack and gets the function return result in a register. TOS (as opposed to Gem) is almost identical to this. Given most C style documentation it is possible to figure out the assembler required to make that Tos call. MiNT calls will be the same.

Now for the C you hate so much ... ;-)

```
main()
{char *s ="wibble";
int16 d =1;
int32 l =2;

printf("%s %d %ld\n",s,d,l);
}
```

which when run produces

```
wibble 1 2
```

on the screen (in case you wondered!). Okay, a standard 680x0 C call pushes arguments right-to-left onto the stack and expects the result (if any) to be in register d0. The caller has to pop the stack - that is the function being called doesn't mess with it like in Pascal. In the above main() pushes the args when calling printf() so main() has to pull them off when printf() returns. There are actually 4 args to printf() above. The expected s,d,l but also included is that incomprehensible string that tells printf() how to print s,d,l which we'll call the format string.

Here's some offbeat assembler ...

```
.format_string
ascii "%s %d %ld\n"
byte 0

.main
//look at the C function, start with the last arg
//then work left pushing each arg in turn until
//you reach the first arg in the C function.
```

```
move.l l,-(sp) //rightmost stacked 1st
move.w d,-(sp) //work left..
move.l s,-(sp)
move.l format_string,-(sp)
jsr printf
adda.l #14,sp //unstack format_string,s,d,l
rts
```

Still here? Now we get to the interesting part. Imagine printf() was part of Tos, it would be nearly identical ...

```
.format_string
.ascii "%s %d %ld\n"
.byte 0

.main
move.l l,-(sp)
move.w d,-(sp)
move.l s,-(sp)
move.l format_string,-(sp)
move.w PRINTF_OPCODE,-(sp) //always pushed before trap
trap some_number
adda.l #16,sp //do PRINTF_OPCODE as well
rts
```

The difference is trivial. (1) the 'jsr' is replaced by a 'trap'. (2) 'PRINTF_OPCODE' is a word value denoting which call we want. (3) Remember to take into account the opcode afterward when unstacking.

So, if someone says the MiNT call Pdomain() is what you need and tells you it is in GEMDOS and has this prototype ...

```
int16 Pdomain(domain); //opcode 281
int16 domain;
```

... then you have all the info you need.

```
move.w domain,-(sp) //push the word representing 'domain'
move.w #281,-(sp) //opcode
trap #1 //gemdos
adda.l 4,sp //unstack opcode,domain
```

Or Pfork()...

```
int16 Pfork(void); //opcode 283

//there aren't any args (void)
move.w #283,-(sp) //opcode
trap $1 //gemdos
adda.l 2,sp //unstack
```

In all cases the return value is in register d0. A LONG, int32 or any kind of pointer takes 32 bits so is in d0.l, whilst WORD and int16 take 32 bits so only take up d0.w (the low 16 bits). Byte sized values are (sign) extended to 16 bit values before pushing them onto the

stack.

A standard C call preserves registers d3-d7, a3-a7. This of course means it can (and will) stomp on registers d0-d2, a0-a2 inside the call you are making.

If you can make GFA call assembler you can add any new OS call you want.

Hi!

Guy Harrison <guy@swampdog.demon.co.uk> wrote:
> If you can make GFA call assembler you can add any new OS call you
> want.

Well, for new GEMDOS calls, it's even possible without any assembler.
GFA provides a generic GEMDOS-function, which you pass the function
number any as many parameters as necessary, either as shorts or longs.

For example, calling Fxattr() from GFA may look like this:

```
FUNCTION fxattr(name$, flag&)
name$=name$+CHR$(0) ! Add the C-style EOS
RETURN GEMDOS(&H12c, L:VARPTR(name$), flag&)
ENDFUNC
```

(Note that this may not be fully correct GFA code, I don't use it
regularly enough, I'm actually a C programmer.)

AFAIR, GFA even has the possibility to call new AES functions filling
the parameter blocks manually, so this should work, too.

Ciao

Thomas

Source record: 2846

Hi All,

I'm right in the midst of writing some audio software for the Falcon (before writing an ST version), and I'm trying to figure out how to use the XBIOS function Buffptr(). From what I understand of it, it should allow me to find out when a sample that I have passed to the play buffer, using Setbuffer() has finished, so that I can send it another. But I can't work out exactly what it is that the function requires as the argument...

There seems to be some contradictory information between the Atari Compendium and the Lattice C reference books (this is the compiler I'm using), and whatever I put in, the compiler complains that it's wrong. Apparently, there's some sort of structure that returns something or other, but I'm clueless :(

If someone could explain it to me (in simpleton's terms), or suggest another way of polling to see if the Falcon's finished playing the last sample, I'd be really grateful. I have tried using the system clock, but the timing's not accurate enough, and it chops off the end of the sample!

Thanks in advance for any help offered.
Danny @ Electronic Cow

Assuming the Compendium is correct 'cos I've never used Buffptr() ...

>There seems to be some contradictory information between the Atari
>Compendium and the Lattice C reference books (this is the compiler I'm
>using), and whatever I put in, the compiler complains that it's wrong.
>Apparently, there's some sort of structure that returns something or other,
>but I'm clueless :(

Buffptr() wants a pointer to 4 consecutive 32 bit values. An array of
4 longs would do but we'll stick with the Compendium definition ...

```
typedef struct {
VOIDP playptr;
VOIDP record;
VOIDP reserved1
VOIDP reserved2
} SBUFPTR; //misleading name

foo()
{SBUFPTR buf; //and here's why, cos I darn well
//nearly missed the fact I'd typed
// SBUFPTR *buf; meself!!!

Buffptr(&buf);
printf("%lx %lx\n",buf.playptr,buf.record);
}
```

If Lattice doesn't like VOIDP then root round and see if it has a
definition for it in one of its headers. If not replace it thus ...

```
typedef struct {
void *playptr;
void *record;
void *reserved1
void *reserved2
```

} SBUFPTR;

Others might suggest

typedef void* VOIDP

but I'd be wary.

>If someone could explain it to me (in simpleton's terms), or suggest another

>not accurate enough, and it chops off the end of the sample!

Different compilers can vary in how they declare certain datatypes.
Although the above will work (Compendium details assumed okay) you
ought to search the Lattice header files and use its definition if one
exists.

I had a lot of trouble with the XBIOS routines when modifying Kay Roemer's
audio device for MiNT.

You might try looking at the sources for this:
http://www.ligotage.demon.co.uk.

But if I remember correctly, I wrote directly to the hardware.

Salut/.

>
>Hmm, this explanation doesnt help either does it ? ;>

Well, that depends mostly on who's reading it, now doesn't it ? ;-)

I do recognize this problem very well, and it is usually due to a
problem with the system hardware. Switching rez in ways unexpected
by the system can cause loss of sync between MMU, which scans the
screen RAM, and GLUE, which generates the physical timing signals
that controls the SHIFTER. In an STe the functions are integrated
into chips slightly differently from in an ST (which I know best)
but I do know that the same problem exists there.

The real cause is probably that the SHIFTER lacks a reliable way
of sensing that a new scan line is starting, so that bitplane
counting should restart from scratch. It just keeps counting in
an eternal cycle, and if a rez switch happens to come in the
middle of a sequence that's just too bad. It will lose sync.

This leads to the shifter using the wrong words for each plane,
and can also lead to horizontal shifts of the picture. The latter
can even happen under monochrome rez, where only one bit plane
exists.

Ways to avoid this depend on finding a way to switch the rez with
100% consistent timing relative to the hardware activity. That is
hard to achieve though, so another trick is to do the switch some
times in succession, back and forth, so that any consistent error
in timing gets compensated for.

You could use Timer-A instead. It's possible to set the DMA-playback to
call a Timer-A interrupt, after the playback has finished. That way you
won't get any samples chopped.

Use Xb-timer() (I think it's called that, anyway), to install your
Timer-A interrupt handler, then enable Timer-A by using Jenabint().
Finally when you start the playback (I don't remember by which function
though), or maybe it was when you set the playback buffers, there should
be an option somewhere to make the computer call Timer-A after playback.

I've managed to do this in assembly-language, and I actually had to use
direct hardware access instead of xbios, so there's no guarantee that
the above will work.

Regards
Henrik

> in detail and timing etc ...

This is actually just a guess, but the FDI is connected to the falcon through the DSP-port, right? Then it would just be a matter of connecting whichever part of the sound system you want to the 'EXTernal' port, because that's what the DSP-port is called. This connection is made in the switch matrix of the sound system, using Devconnect().

If you want to send data out through the DSP-port from the DSP, then you need to connect
'DSP XMIT' to 'EXT' by using the Devconnect()-call in the xbios. Also don't forget to call Dsp-tristate() to connect the output of the DSP to the switch matrix, otherwise you won't hear a thing.

In the DSP, you need to configure its Port C to SSI-mode (in the Port C Control Register, PCCR). Also the CRB need to be set to: 16bit, 2 channels network mode. For doing this the "DSP56000/DSP56001 User's Manual" from Motorola is highly recommended, I don't recall the exact values to write to these registers. Of course that "16bit" may be changed to 8, 12 or 24 instead.

I have no idea if there is more to it than this in order to send data through the FDI. I don't know if there is some special stuff you have to do, but I can't imagine anything.

Regards
Henrik

I think doing the switch during the vertical blank should be as close as
possible to the 100% consistency.

Source record: 2757

Hi all,

For anyone how as seen Mega disczine then you are more than welcome to join out mailing list. Please see my site at ....

www.mega-disczine.freeserve.co.uk

Please find at the base of the main screen the subscribe box. This is my "new" site and is still undercostrucion, if you find any broken links you can try my old site at....

www.users.zetnet.co.uk/mega.disczine/

You should also find the first 3 issues of Mega on my new web site.

Rather a lot of people have had problems regarding issue 1 and issue 2 in relation to the mouse and keyboard not responding or they were unable to unpack the files correctly to the floppy. This list will come in useful to anyone who has had such problems. Issue 3 was corrected in all these matter but going by the amount of "complaints" in running issue 1 and 2, this list should help you all out.

Due to a problem with my PC (yup I'm a bad boy arn't I ?!?!) I lost most of the files which had been linded up for the next issue. This of course means that issue 4 will be released a little latter than was expected. If you would like to contribute anything at all then please feel free to E-mail me , or post your comments to the mega list.

We are currently planning a STOS "quiz" in the near future. Most of these will be simple projects to help beginner problem solve and get used to how all the STOS commands are used. The first "tutorial" is underway at the moment and most STOS users should be able to solve the puzzles we set to you. Its for fun, advanced uers can also join for the fun as well if they wish , though you may not be interested in the beginners tutorials at this time.

Once the list is setup and running how we want it , with more users also we already have a handful of users already even before this post) I'll start to post the files. These files are only simple (small) files so you should not have to worry about long downloads. You will receive 1 zip file which will contain 2 files, one will be the STOS .BAS file for you to work with, the other will be a compiled .CMP file which will be the working code which you must make the basic program do. Once you think you have done it you can post back to me your ammended files for evaluation. I will also be posting on the list things like the "top ten fastest coders" . Ok, maybe its not fair to people who don't have much free time but we can work this out at a later date. Should anyof you need any extra help then just post to

the list and I'll help you, others users will also be able to see what everone else write so we can all learn as a group.

As said before, its for fun and to learn STOS. You can subscribe and unsubscribe anytime you wish. If you need any further information of questions then please E-mail be.

Keep STOSing....

Correct, but it is not so easy to know exactly when that will be, except
by disabling all interrupts, and that can not be tolerated for any long
periods of time (max 100 microsec IMHO, which is not enough).

Just calling XBIOS Vsync is not effective, as that only ensures a delay,
not that return to the calling code will be in a specific time slot
relative to the Vblank edges.

Hmmm, perhaps a temporary patch of the VBI exception vector is the best
way to (almost) make sure of it.

Something like this (as written for my DevPac libs):

```
;-------------------------------------
main_code:
move.b #wanted_rez_code,switch_rez ;choose wanted rez
xbios Supexec,switch_sub(pc) ;set wanted rez
bsr mainwork ;work in wanted rez
xbios Supexec,switch_sub(pc) ;restore original rez
rts ;return to caller
;-------
switch_sub:
move.b (hw_rez).w,d0 ;d0 = rez code from hardware
and.b #3,d0 ;mask off unimplemented bits
cmp.b switch_rez(pc),d0 ;check if wanted rez is active
beq.s .exit ;if lucky, exit directly
move sr,d1 ;d1 = sr (get interrupt mask)
ori #$0700,sr ;disable interrupts
move.l (ev_VBI).w,old_VBI_p ;link XBRA struct to old code
move.l #new_VBI,(ev_VBI).w ;install the new VBI code
sf switch_flag ;clear a flag to be set later
move d1,sr ;reenable interrupts
.wait_for_it:
tst.b switch_flag ;done yet ?
```

```
beq.s .wait_for_it ;loop until switch done
move d0,switch_rez ;switch_rez = old rez
.exit:
rts ;return to caller
;-------
new_VBI_XB:
dc.l 'XBRA','RezS' ;XBRA magic and identifier
old_VBI_p:
dc.l NULL ;XBRA link
new_VBI:
move.b switch_rez(pc),(hw_rez).w ;SWITCH REZ
st switch_flag ;tell switch_sub it's done
move.l old_VBI_p(pc),(ev_VBI).w ;restore old VBI handler
move.l (ev_VBI).w,-(sp) ;push ptr to old handler
rts ;and let it do its usual work
;-------
switch_rez:
dc.b 0 ;byte variable = rez code for next switch
switch_flag:
dc.b 0 ;byte variable = switch completion flag
;-------------------------------------
```

This method should work for all cases except where some higher interrupt manages to delay the first instruction at new_VBI above. That should not happen often, and will probably not cause any error anyway, as such interrupt routines should execute very quickly (to avoid system errors).

Hmm, Perhaps this could even fix the syncing problems I had in LaceScan.

3248. AES-Messages

Newsgroup: comp.sys.atari.programmer
Date: 1999-06-03 00:00:00 UTC
From: Daniel Augsburger <skydiver@jumpgates.com>
Message-ID: <37563ABB.2503E042@jumpgates.com>
Source record: 2765

Hello there

I'm writing a screen saver (with GNU C under MagiC 6.x on a TT) and now I'm looking for a way to ask all running apps to redraw their windows. I wrote the following code to send a redraw message to all owners of a window but none of the supposed receivers does any redraw. It seems as if they don't receive any message from me.

```
wind_get(-1, WF_TOP, &wind, &owner, &wind_below, &wind_above);
while (wind != -1)
{
wind_get(wind, WF_OWNER, &owner, &stat, &wind_above,
&wind_below);
m[0] = WM_REDRAW;
m[1] = gl_apid;
m[2] = 0;
m[3] = wind;
m[4] = sx;
m[5] = sy;
m[6] = sw;
m[7] = sh;
appl_write(owner, 16, m);
wind = wind_below;
}
```

Another question: wind_get() with WF_OWNER is recognised only by AES 4.00 or higher, what method could be used to retrieve the same information under older versions of AES (for example Single TOS)?

----- snip ----- re: how to refresh windows of all other APPs
>
>Another question: wind_get() with WF_OWNER is recognised only by AES
>4.00 or higher, what method could be used to retrieve the same
>information under older versions of AES (for example Single TOS)?

I use AES form_dial for such things, and that works fine in all TOS.
Essentially I use a box that covers all of screen (except menu), and
that causes the AES itself to send update messages to all APPs that
have any windows on the visible screen.

Here is a code example from my devpac libs, that should give you an
idea of what I mean.
;-------
gem_aes wind_get,#0,#5 ;ask for desktop area info
move intout+2(pc),zz_wx ;copy X
move intout+4(pc),zz_wy ;copy Y
move intout+6(pc),zz_ww ;copy width
move intout+8(pc),zz_wh ;copy height
gem_aes form_dial,#0,#0,#0,#0,#0,zz_wx,zz_wy,zz_ww,zz_wh
gem_aes form_dial,#3,#0,#0,#0,#0,zz_wx,zz_wy,zz_ww,zz_wh
;-------

It is always best to let the AES itself choose which messages to use,
as that ensures that it will be done as best adapted to that AES.

NB:
I have seen some programs use only form_dial(3,...) to do this kind
of thing, but with severe compatibility problems. Such calls should
always be paired with some preceding form_dial(0,...) for exactly
the same area. Otherwise parts of AES, and/or loaded AES enhancers,
may become very confused as to what is going on.

3251. Info on shel_write() and TOS return values

Newsgroup: comp.sys.atari.programmer
Date: 1999-06-03 00:00:00 UTC
From: David Bolt <dbolt@my-ste.demon.co.uk>
Message-ID: <rLVJpDAlnuV3EwJI@my-ste.demon.co.uk>
Source record: 2768

Simple question really, I've a TOS program that is called using the
following call:

```
ret=shel_write(1,0,100,name,cmd_line);
```

The problem is, if there's any error value returned, I don't see it and
the calling program doesn't know anything about it. What I want to know
is, is there a way of getting at this return value?

The GEMDOS return value is submitted by a CH_EXIT (90) message. msg[3] is the
id of the terminated process, msg[4] is the return value

> }
>
>Another question: wind_get() with WF_OWNER is recognised only by AES
>4.00 or higher, what method could be used to retrieve the same
>information under older versions of AES (for example Single TOS)?

Snippets from SdTidyUp ...

```
wind_get(WH_DESKTOP,WF_WORKXYWH,PRECT(desk));
menu_bar(menu,1);
menu_bar(menu,0);
form_dial(FMD_START,1,1,1,1,desk);
form_dial(FMD_FINISH,1,1,1,1,desk);
```

I noticed that the desktop can't always be convinced to redraw its
menu bar. Hence the above kludges in a temporary (blank) one, thus
forcing the desktop to replace its own when it is removed.

GH> form_dial(FMD_FINISH,1,1,1,1,desk);
IIRC it's only documented that a single form_dial(FMD_FINISH) will produce a redraw. A possible problem with your version might be that the AES or a tool may catch these calls, buffer the area at the form_dial(FMD_START) and simplyreplaces it at the form_dial(FMD_FINISH)

'ret' only fails here if shel_write fails (to launch the program or
something).

Your app will be sent a message when the child terminates - CH_EXIT.
The return code is in one of the message buffer entries.

That's exactly what you want. If you omit the FMD_START the AES may attempt to release an area it hadn't actually reserved. Better to waste a little bit of time rather than introduce an unknown factor!

That's not a matter of time.
If there is a tool that buffers/restores the area when doing a
form_dial(FMD_START/FMD_FINISH) you will get no redraw because the "wrong"
content of the area will simply be saved and then restored. If the
form_dial(FMD_START) is missing there is no chance to restore the area from a
buffer, so a redraw must be sent

For what it's worth, when I bought my copy of Lattice, I gave
away Prospero. Prospero's not nearly as powerful as Lattice,
lacks a number of features, and uses a very odd format of make
file. But, Prospero's editor is much better.

No tool should ever do this.

>If the
>form_dial(FMD_START) is missing there is no chance to restore the area from a
>buffer, so a redraw must be sent

That's why a tool shouldn't do it. It has no way of knowing where its buffer relates in comparison with everything else on the screen. To do it this way would require it to interrogate the window pile so that it only restored the bits of itself that would be visible by the time everything else had finished redrawing [wot a long sentence!] ;-)

If it were to do all that it may as well wait for a WM_REDRAW.

Besides, it couldn't actually use such a technique. The AES can be particularly stupid - it'll not always pass exact sizes for redraws. Sometimes they are bigger than necessary.

For its time it was good. It uses the same environment as their Pascal compiler (I have both). Their Pascal was an extremely good implementation at the time - far better than the poly mainframe!

If their C had caught on it would probably be every bit as good as Lattice but it didn't and it isn't. The debugger is good (for its time), being the same as the Pascal one.

I haven't a clue about the quality of its code generation. What really matters is its Atari libraries. Old and out of date. It is of course possible to update them. I did toy with the idea of binning the lot and recompiling all my MWC ones (for which I have all the sources). Would have been a satisfying exercise but of no practical value.

>The reason I ask is because I bought (used) copies of both (due to a >misunderstanding with the vendor) and am wondering whether the Prospero >is worth keeping or whether I should try and sell it.

Keep Lattice.

General question to everybody ...

Don't suppose anybody ever hacked the ProC IDE to prevent it moaning about what rez it is in? [only likes high and medium, probably looking at Getrez()]

That's not neccessary. form_dial() is only used for modal dialogs where you
have to lock the screen with wind_update(). And if the screen is locked no
other application can change it's content. It really is no problem to save
the dialog background before drawing it and restore it for erasing it before
unlocking the screen

That's absolutely correct Guy.

There are several AES enhancers that get seriously confused if these calls
are not used correctly in 'pairs' as described above.

But any tool which attempts to buffer window areas in such a primitive way
is itself in error doing so. The correct way to redraw a window area is
to let the AES send window update messages to the APP that owns the window.
And ensuring that this is done correctly is the main purpose of form_dial
function calls, and that is why they *must* be 'paired' correctly.

AFAIK it is not legal for an APP to 'release' an area without first having
'reserved' that same area.

Hi Ronald!

RA>But any tool which attempts to buffer window areas in such a primitive
RA>way is itself in error doing so.
Why?

RA>The correct way to redraw a window area is to let the AES send window
RA>update messages to the APP that owns the window.
The AES could use the buffer method too!
What do you think why there ist form_dial(FMD_START)? Just for sending a
redraw message form_dial(FMD_FINISH) would be enough

RA>And ensuring that this is done correctly is the main purpose of
RA>form_dial function calls, and that is why they *must* be 'paired'
RA>correctly.
The intention of form_dial() is to restore the screen after a dialog was
displayed. To send a redraw message is only one possible way of doing this

RA>AFAIK it is not legal for an APP to 'release' an area without first
RA>having 'reserved' that same area.
IIRC it's documented by ATARI to send a redraw message to all (affected)
applications by doing a single form_dial(FMD_FINISH). And as I mentioned
using a pair for doing so can cause problems

Where can I find some source code for doing popups?

I am aware that the menu_popup call is available from AES 3.30 - but I'd like to be able to use popups in earlier AES versions.

I tried to write my own, but problems arose when I tried to buffer the "dirtied" area of screen with vro_cpyfm - nothing got saved, and the dirtied area of screen remained "dirty" which is not very useful when called from a dialog box handler, or when popup extends outside the dialog borders.

(I am using a TT with TOS 3.05, AES 4.1 (singletasking), Speedo 4.1)

The offending code looked something like this:

```
screenram = (width * height * planes) / 8;

if( screen = calloc( screenram, 1 ) ) {
screenmfdb.fd_addr = NULL;

fill in memory mfdb

fill in coord array

// everything is OK up to here

vro_cpyfm( vhandle, S_ONLY, coord_array, &screenmfdb, &memmfdb )

// the memory buffer pointed to by screen var remains empty

hide mouse
draw popup
show mouse

interact with popup

fill in coord array #2

hide mouse
vro_cpyfm( vhandle, S_ONLY, coord_array2, &memmfdb, &sourcemfdb )
show mouse

free screen memory
}
```

Where can I find some source code for doing popups?

I am aware that the menu_popup call is available from AES 3.30 - but I'd like to be able to use popups in earlier AES versions, so that means that I'll have to emulate popup menus.

I tried to write my own, but problems arose when I tried to buffer the "dirtied" area of screen with vro_cpyfm - nothing got saved, and the dirtied area of screen remained "dirty" which is not very useful when called from a dialog box handler, or when popup extends outside the dialog borders.

(I am using a TT with TOS 3.05, AES 4.1 (singletasking), Speedo 4.1)
(It was written in Lattice C 5.60)

The offending code looks like this:

```
#include "0/types.h" // "uint32", "sint16" ...

#include <stdlib.h> // calloc

#include <aes.h>
#include <vdi.h>

#include "popup.h" // prototypes

int Popup( MENU *srcmnu, int x, int y, MENU *destmnu )
{
GRECT desk; // desktop rectangle
uint32 screenram; // ram needed to buffer dirty screen
void *screenptr; // pointer to allocated screen buffer

sint16 vhandle, d; // VDI handle, dummy var

// used to open virtual workstation
static sint16 vwi[11] = { 1, 1, 1, 1, 1, 1, 1, 1, 1, 2 };
sint16 vwo[2][57];

// disable call to AES, force all code to "emulate" popups
// ADVANCE is a label that has not been #defined
#ifdef ADVANCE
if( _AESglobal[0] >= 0x330 )
return menu_popup( srcmnu, x, y, destmnu );
#endif

vhandle = graf_handle( &d, &d, &d, &d ); // get AES's VDI handle
v_opnvwk( vwi, &vhandle, vwo[0] ); // open virtual workstation
vq_extnd( vhandle, 1, vwo[1] ); // get extendeed info
```

```
// get desktop work area
wind_get( DESK, WF_WORKXYWH, &desk.g_x, &desk.g_y, &desk.g_w, &desk.g_h );

// center popup menu on coordinates x and y
srcmnu -> mn_tree[ROOT].ob_x = x - srcmnu -> mn_tree[srcmnu -> mn_item].ob_x;
srcmnu -> mn_tree[ROOT].ob_y = y - srcmnu -> mn_tree[srcmnu -> mn_item].ob_y;

//rc_constrain( &g, (GRECT *)&srcmnu -> mn_tree[ROOT].ob_x );

// calculate amount of scrren ram needed
screenram = ((vwo[0][0] + 1) * (vwo[0][1] + 1) * vwo[1][4]) >> 3;

// allocate it
screenptr = calloc( screenram, 1 );
if( screenptr ) {
MFDB srcmfdb, destmfdb; // MFDB's used in vro_cpyfm "blit"
sint16 arr[8+4]; // coordinate array
// sint16 mb, mx, my; // mouse button & coords

srcmfdb.fd_addr = NULL; // source is on screen

// fill in dest MFDB
destmfdb.fd_addr = screenptr; // addr of allocated RAM
destmfdb.fd_w = vwo[0][0] + 1; // width of RAM
destmfdb.fd_h = vwo[0][1] + 1; // height of RAM
destmfdb.fd_wdwidth = destmfdb.fd_w / 16; // word width
destmfdb.fd_stand = 0; // device specific
destmfdb.fd_nplanes = vwo[1][4]; // number of bitplanes
destmfdb.fd_r1 = 0;
destmfdb.fd_r2 = 0;
destmfdb.fd_r3 = 0;

// set coordinate array
// 0..3 = source rect
// 4..7 = dest rect
// 8..11 = source rect (copy of 0..3)
arr[8+0] = arr[0] = srcmnu -> mn_tree[ROOT].ob_x;
arr[8+1] = arr[1] = srcmnu -> mn_tree[ROOT].ob_y;
arr[8+2] = arr[2] = srcmnu -> mn_tree[ROOT].ob_x + srcmnu -> mn_tree[ROOT].ob_width - 1;
arr[8+3] = arr[3] = srcmnu -> mn_tree[ROOT].ob_y + srcmnu -> mn_tree[ROOT].ob_height - 1;
arr[4] = 0;
arr[5] = 0;
arr[6] = srcmnu -> mn_tree[ROOT].ob_width - 1;
arr[7] = srcmnu -> mn_tree[ROOT].ob_height - 1;

// "pop up" menu
// hide mouse, save "dirtied" area, draw menu, unhide mouse
v_hide_c( vhandle );
vro_cpyfm( vhandle, S_ONLY, &arr[0], &srcmfdb, &destmfdb );
objc_draw( srcmnu -> mn_tree, ROOT, MAX_DEPTH, srcmnu -> mn_tree[ROOT].ob_x, srcmnu ->
mn_tree[ROOT].ob_y, srcmnu -> mn_tree[ROOT].ob_width, srcmnu -> mn_tree[ROOT].ob_height );
v_show_c( vhandle, 1 );
```

```
// loop until mouse button clicked
//do {
//
//
// vq_mouse( vhandle, &mb, &mx, &my );
//} while( !mb );

// restore dirtied screen
// hide mouse, copy saved to screen, unhide mouse
v_hide_c( vhandle );
vro_cpyfm( vhandle, S_ONLY, &arr[4], &destmfdb, &srcmfdb );
v_show_c( vhandle, 1 );

// release ram
free( screenptr );
}

// deallocate VDI handle
v_clsvwk( vhandle );

// return result
return 0;
}
```

Hi!

In article <7jnujdhpd1@newshost.comnet.co.nz>,
gmiller@inca.co.nz (Gaven Miller) writes:
> v_opnvwk(vwi, &vhandle, vwo[0]); // open virtual workstation

Don't forget to ensure vhandle is non-zero afterwards.

> destmfdb.fd_wdwidth = destmfdb.fd_w / 16; // word width

This should be (destmfdb.fd_w + 15) / 16, as otherwise the value gets
one too low if the width isn't dividable by 16 (1 pixel already means a
word width of 1, not 0!)

> // hide mouse, save "dirtied" area, draw menu, unhide mouse
> v_hide_c(vhandle);

Uhh, do NOT use the VDI calls to influence or query the mouse! The AES
has its functions for that, so use them. Grab mouse control via

wind_update(BEG_MCTRL);

and use graf_mouse() to hide/unhide the mouse, and
evnt_button()/_multi() to query position and button states.

Btw, your code is also missing a

wind_update(BEG_UPDATE);

to reserve the screen for displaying a dialog. And of course, don'
forget to free both locks afterwards :)

> vro_cpyfm(vhandle, S_ONLY, &arr[4], &destmfdb, &srcmfdb);

Here, I'd re-initialize the screen's MFDB, i.e. srcmfdb.fd_addr = NULL;
Maybe that's the reason it doesn't work for you. The rest /looks/ OK,
but as I haven't tested it, I can't guarantee I haven't overlooked
something.

Another advice: Don't allocate memory for saving the whole screen
contents when there's only need to save the area for a small popup menu
- on larger displays, you easily end up allocating megabytes for the
whole screen!

Ciao

Thomas

Thanks for the response.

Most of what you say is common sense - which I was sadly lacking at the time I wrote the code. I went and bought some more common-sense from my local supermarket today. {[:-)]

> Uhh, do NOT use the VDI calls to influence or query the mouse! The AES
> has its functions for that, so use them. Grab mouse control via

Wouldn't it be OK if they are called in pairs? I call v_hide_c and then do my stuff, and when I've finished I call v_show_c, passing the parameter 1 which means "show it only if the current hide depth is zero".

And, with the code shown, the only way out of the code is via the "cleanup" at the end of it, which unhides the mouse, deallocates the buffer etc.

Do wind_update calls nest? AFAIK, they just set and clear a flag.

I already use wind_update(BEG/END_UPDATE) as part of my do_form() dialog handler (from which the popups are called). I know the graf_mouse calls next, but am unsure of wind_update.

Every call prior to the vro_cpyfm blit into the offscreen buffer was OK while I was debugging, but when I use MON to inspect the allocated buffer,

it is still blank after the blit into it - it should have the FL3DBAK pattern (which is nonzero) in it, but no sign in the first 12-16k, even though I blit into the buffer at coord (0,0).

Yes, they do. You can do 50 BEG_UPDATEs and you won't be returning control
until you've also done 50 END_UPDATEs.

>Hi Ronald!
>
>RA>But any tool which attempts to buffer window areas in such a primitive
>RA>way is itself in error doing so.
>Why?

Because it is neither the responsibility, nor the right, of a single utility,
not even of AES as a whole, to handle update of the entire screen normally.

GEM is based on the idea that several different APPs share the screen, and
that each such APP *must* take its own responsibility for updating the screen
areas that are used for the work areas of its windows. The AES itself only
has responsibility for refreshing window frames, desktop background, and to
some limited extent the current menu (responsibility shared with top APP).

Simple buffering of the entire screen is not a part of this concept.

>RA>The correct way to redraw a window area is to let the AES send window
>RA>update messages to the APP that owns the window.
>The AES could use the buffer method too!

As stated above, that would be a non-GEM method of implementation. Only a
few special screen operations should use that method, such as drop down
menus. In any case form_dial(FMD_FINISH) should always result in messages
being sent to the owners of windows underlying the specified rectangle.

>What do you think why there ist form_dial(FMD_START)? Just for sending a
>redraw message form_dial(FMD_FINISH) would be enough

form_dial(FMD_FINISH) should cause the same window update messages when used
alone, this much is true, but it is still not advisable to use it that way.

The AES can and should use the FMD_START call as a signal to buffer only
the parts of the screen that are normally owned by the AES, as stated above.
Many AES enhancements link into this call however, and add interpretations
of their own, and in most cases these *require* paired usage.

>RA>And ensuring that this is done correctly is the main purpose of
>RA>form_dial function calls, and that is why they *must* be 'paired'
>RA>correctly.
>The intention of form_dial() is to restore the screen after a dialog was
>displayed. To send a redraw message is only one possible way of doing this

Redraw messages are the only legal GEM method of redrawing the work areas
of windows belonging to other APPs. For its own windows any APP may use
whatever method it pleases (while screen is locked for updating), but not

for any other areas. Those must be handled through GEM.

>RA>AFAIK it is not legal for an APP to 'release' an area without first
>RA>having 'reserved' that same area.
>IIRC it's documented by ATARI to send a redraw message to all (affected)
>applications by doing a single form_dial(FMD_FINISH). And as I mentioned
>using a pair for doing so can cause problems

Atari have described separately the use of many functions, which even so are in many cases dependent on being used with other functions. That is the case here too. Putting it differently, the use of FMD_FINISH implies an earlier use of FMD_START. (else what is being finished ?)

Using paired form_dial calls as described can not cause any problem at all in a correct GEM implementation, as the FMD_FINISH call should always result in window update messages for the entire surface of the specified rectangle, or direct restoration of desktop background for those parts of that surface not owned by any APP.

Good point.
Checking error returns should really be done after all function calls that
can use such, and far too many programmers just ignore these possibilities.

>
>> destmfdb.fd_wdwidth = destmfdb.fd_w / 16; // word width

Yes, rounding up is very important. Even more so when calculating sizes
of buffers that need to be allocated, as any mistake causing those to be
too short can cause bombs.

----- snip ----- re: some more stuff on which I simply agree

>Another advice: Don't allocate memory for saving the whole screen
>contents when there's only need to save the area for a small popup menu

For this kind of thing we really should apply the same reasoning that was
used for the design of GEM itself. This means that it is ok to use simple
buffering as long as the surface is a small portion of the total screen,
but if it is larger than a quarter of the full screen then it is better to
handle the redraw needs by AES window update messages.

Hi Ronald!

RA>Because it is neither the responsibility, nor the right, of a single
RA>utility, not even of AES as a whole, to handle update of the entire
RA>screen normally.
Again: why?

RA>GEM is based on the idea that several different APPs share the screen,
RA>and that each such APP *must* take its own responsibility for updating
RA>the screen areas that are used for the work areas of its windows. The
RA>AES itself only has responsibility for refreshing window frames,
RA>desktop background, and to some limited extent the current
RA>menu (responsibility shared with top APP).
Yes, but only if there is something that has to be restored because it wasn'
t buffered before (-> drop down menus)

RA>Simple buffering of the entire screen is not a part of this concept.
No one's talking about the whole screen (in general)

RA>As stated above, that would be a non-GEM method of implementation.
RA>Only a few special screen operations should use that method, such as
RA>drop down menus.
And why is the buffer method used there?
Think back when GEM was developed!
Memory was expensive. For drop down menus the fast redraw was neccessary
because the handling would have been much too slow ig it would have been done
by redraws. Buffering dialogs would have cost the expensive memory of another
buffer. As the speed of restoring the dialog background wasn't that time
critical they could use the more cheap redraw method.
IMHO the presence of form_dial(FMD_START) indicates that the buffering was
planned or at least DR didn't want to say no to the buffering method in
future, when memory would be cheaper

RA>In any case form_dial(FMD_FINISH) should always result in messages
RA>being sent to the owners of windows underlying the specified rectangle.
No, it should result in a redraw (it defines an aim, not a method)

RA>form_dial(FMD_FINISH) should cause the same window update messages
RA>when used alone, this much is true, but it is still not advisable to
RA>use it that way.
AFAIK Atari documented it that way. And this is not advisable then?

RA>The AES can and should use the FMD_START call as a signal to buffer
RA>only the parts of the screen that are normally owned by the AES, as
RA>stated above.
Why should the AES buffer something and the applications cannot?

This would be a too inconsequent design

RA>Many AES enhancements link into this call however, and add
RA>interpretations of their own, and in most cases these *require* paired
RA>usage.
Many software has bugs

RA>Redraw messages are the only legal GEM method of redrawing the work
RA>areas of windows belonging to other APPs.
Yes

RA>For its own windows any APP may use whatever method it pleases (while
RA>screen is locked for updating), but not for any other areas. Those
RA>must be handled through GEM.
form_dial() calls _are_ GEM (even if they are provided by a GEM extension
like a utility)

RA>Atari have described separately the use of many functions, which even
RA>so are in many cases dependent on being used with other functions.
RA>That is the case here too.
AFAIK this is not the case here

RA>Putting it differently, the use of FMD_FINISH implies an earlier use
RA>of FMD_START. (else what is being finished ?)
IMHO the documentation of the single use of form_dial(FMS_FINISH) is a hack
by Atari for sending a redraw message to all applications because of lacking
a broadcast. It certainly would have been better to implement a broadcast
insted but that wouldn't have been compatible with the first versions :-(

RA>Using paired form_dial calls as described can not cause any problem at
RA>all in a correct GEM implementation, as the FMD_FINISH call should
RA>always result in window update messages for the entire surface of the
RA>specified rectangle, or direct restoration of desktop background for
RA>those parts of that surface not owned by any APP.
form_dial() is a specification of an interface, not an implementation. And I
don't believe that you can find a documentation of the used algorithm. That's
simply because an interfacec is an abstraction from the algorithm behind it
with the advantage that you can change the algorithm

Bye

I'm surprised there aren't more.

I believe the original AES used a fixed buffer for this (perhaps I'm
thinking of the menu buffer - yes probably). Most likely the
"confused" AES enhancers are doing things gracefully via Malloc/Free?

If you feel like implementing it via a window rather than the VDI I
could go dig out the code in Pug. It did it dynamically - created and
opened a blank window, white G_BOX, required number of G_STRINGS
slapped on it.

I've got some VDI "grab/restore selected screen area dynamically" code
lurking about somewhere as well.

>Again: why?

Because if every program was responsible for protecting the underlying surface of the screen for all their displays, then the entire system RAM would soon be used up for a lot of screen buffers, all of which would mainly be duplicates of each other, with minor update differencies. The same applies, with irrelevant variations, if the AES itself would do this same kind of primitive buffering when APPs open windows etc. In both cases this kind of approach leads to extreme waste of system RAM space, and for large resolutions the extensive buffer copying will consume more time than the overhead costs of a message system.

The methods of GEM were designed especially to avoid such inefficiencies by requiring only that each APP be able to redraw the information for those windows that it owns, and that appropriate messages are sent to allow all APPs involved to do their parts of this work. The AES itself works as the message center for this update work, ensuring that all APPs are told to update only the relevant portions of the screen.

The only exceptions (small dialogs, menus, popups) are for small areas of extremely temporary nature, where the savings would not motivate the overhead costs of the message system. (Could cause significant slowness)

These are the main design principles of GEM AES screen updating, and any method which abandons these principles is thereby a non-GEM method.

>RA>Simple buffering of the entire screen is not a part of this concept.
>
>No one's talking about the whole screen (in general)

But that was the subject of the original post.
How to cause GEM to refresh the entire screen !

And for that particular purpose it is definitely wrong for any part of the system to implement it by a simple buffering scheme.

>RA>As stated above, that would be a non-GEM method of implementation.
>RA>Only a few special screen operations should use that method, such as
>RA>drop down menus.

>
>And why is the buffer method used there?

Because they concern so small and temporary screen usage that their
incorporation in the rectangle lists would cause an unwarranted and
overly large overhead.

>Think back when GEM was developed!
>Memory was expensive. For drop down menus the fast redraw was neccessary
>because the handling would have been much too slow ig it would have been done
>by redraws. Buffering dialogs would have cost the expensive memory of another
>buffer. As the speed of restoring the dialog background wasn't that time
>critical they could use the more cheap redraw method.

I am aware of all that.

>IMHO the presence of form_dial(FMD_START) indicates that the buffering was
>planned

I don't see why. Proper reservation of update rectangles is meaningful
regardless of what scheme is used to restore the surface content later,
and that is why DR included it. To keep the interface symmetrical and
avoid dependency on any particular internal redraw implementation.

>or at least DR didn't want to say no to the buffering method in future,

They did not want to impose any limits for the future, this is true,
but I doubt that they considered simple buffering schemes suitable.

They were much more aware of multiprocess needs than Atari were, and
it is very clear even from the earliest GEM documentation that DR were
intending to make this into a real multitasking system. Unfortunately
Apple (who themselves had stolen most McIntosh ideas from 'Smalltalk')
threatened them with a costly lawsuit if they didn't drop those plans.

Those threats were not realistic, as Apple didn't really have a solid
case (like I said, they had stolen most ideas too), but DR could not
afford even a case they would win, so they backed down. That is why
GEM developments were frozen for so many years, until Atari managed
to 'mollify' Apple, who were no longer worried about PCs being given
GEM to outcompete McIntosh (as DR had originally planned).

>when memory would be cheaper

That is not really relevant. As RAM size increases at lowered prices, the
screen resolution sizes also rise, making 'simple buffering' as unsuitable
today as when GEM was newborn.

eg:
My normal work resolution is 960x720 pixels with 8 bitplanes. This means
that the screen size is 691200 bytes, and as (on all TOS systems) the max
ST-RAM size is 14680064 bytes, the screen size is appx 4.7% of total RAM,
meaning that the 'blittable' RAM can hold at most 21 such buffers.
(But then all DMA IO becomes blocked, as it too needs ST-RAM.)

GEM was originally designed for STs, where the screen size is 32000 bytes
for all original resolutions. The most common STs had a RAM size of just
one megabyte, which is 1048576 bytes, making the screen portion of that
size appx 3.05%, meaning that the RAM could hold at most 32 such buffers.
(Again ignoring all other RAM needs.)

As you can see, the situation is actually worse now on my expanded Falcon,
than it was in the old days on a 1040 STFM. Simple full-screen buffering
still leads to disastrous RAM waste. The same goes for buffer copying time
when the screen RAM size is now over twenty times larger.

Arguably, the 520 ST could have been used for the comparison instead,
but the numbers are not sufficiently different (max 16 buffers) to make
me feel that the situation has changed very much since then.

>RA>In any case form_dial(FMD_FINISH) should always result in messages
>RA>being sent to the owners of windows underlying the specified rectangle.
>
>No, it should result in a redraw (it defines an aim, not a method)

Nitpicking, but correct I suppose :-)
The form_dial call does only define that a redraw should be performed.
It is the design principles of GEM that defines that it should be done
by sending redraw messages to the window owners. This alters nothing.

>RA>form_dial(FMD_FINISH) should cause the same window update messages
>RA>when used alone, this much is true, but it is still not advisable to
>RA>use it that way.
>
>AFAIK Atari documented it that way. And this is not advisable then?

AFAIK they did not documented it that way. What they did was to describe
the functions as separate entitities, which they always did even for those
functions that are dependent on others having been called earlier. The need
for such things being used symmetrically is mostly inherent in the design.

eg:
appl_init and appl_exit are used to log in and later to log out an APP in
the GEM system. There is never any need to explicitly state the rule that
appl_exit should not be used without first having called appl_init, as the
dependency is implicit in the context.

The same (in a very different context) goes for FMD_START and FMD_FINISH.
The latter is used to finish a graphic process, so that the screen can be
restored to what it should be (according to AES and all GEM APPs), and it
is not sensible to finish something that was never started.

>RA>The AES can and should use the FMD_START call as a signal to buffer
>RA>only the parts of the screen that are normally owned by the AES, as
>RA>stated above.
>
>Why should the AES buffer something and the applications cannot?

Because they work on different system levels, this can sometimes be useful, without inconsistency. Thinking more deeply about it, however, I don't see that AES really does need to buffer anything in this particular case. But it should take note of the rectangle reservation.

>This would be a too inconsequent design

You mean 'inconsistent' in english. 'Inconsequent' is not a useful form, and the closest useful one ("inconsequential") does not have the same meaning as the german word you were probably thinking of. Instead it is more synonymous with 'unimportant', which I do not think that you meant.

Fortunately I know some german, and 'inkonsekvent' means the same thing in swedish too, but you should avoid using 'inconsequent' in discussions with people that only know english. They might feel insulted by it, as it does mean that you find what they said to be so unimportant as to lack any relevant meaning.

>RA>Many AES enhancements link into this call however, and add
>RA>interpretations of their own, and in most cases these *require* paired
>RA>usage.
>
>Many software has bugs

Yes, but I would hesitate to call this a bug. It is a dependency of a kind that I too would prefer for programmers to avoid, regardless of the screen update methods used. Nevertheless, much existing software does have such dependencies.

>RA>Redraw messages are the only legal GEM method of redrawing the work
>RA>areas of windows belonging to other APPs.
>
>Yes

I'm glad we agree on one basic premise at least :-)

>RA>For its own windows any APP may use whatever method it pleases (while
>RA>screen is locked for updating), but not for any other areas. Those
>RA>must be handled through GEM.
>
>form_dial() calls _are_ GEM (even if they are provided by a GEM extension
>like a utility)

That is true of course, and I did not mean to imply that they were not. What I referred to here was direct restoration from a screen buffer into screen areas owned by some other APP. That would be quite illegal.

>RA>Atari have described separately the use of many functions, which even
>RA>so are in many cases dependent on being used with other functions.
>RA>That is the case here too.
>
>AFAIK this is not the case here

That is a matter of opinion which can hardly be proven either way, nor is it even certain that any proof about Atari opinions would be strictly

relevant today anyway, since they dropped active development of GEM long ago (when they abandoned Falcon for concentrating on Jaguar).

The fact remains that used as I recommend, the function will not cause any known software to misbehave, whereas the method you recommend, of using FMD_FINISH alone, will cause some software to misbehave and/or even bomb. 'Right or wrong' aside, this does mean that programs using my recommended way of using form_dial will run problem free for a larger number of users.

>RA>Putting it differently, the use of FMD_FINISH implies an earlier use
>RA>of FMD_START. (else what is being finished ?)
>
>IMHO the documentation of the single use of form_dial(FMS_FINISH) is a hack
>by Atari for sending a redraw message to all applications because of lacking
>a broadcast. It certainly would have been better to implement a broadcast
>insted but that wouldn't have been compatible with the first versions :-(

And that 'hack' was written at at time when the current multitasking systems (not to mention their extensive enhancements) had not even been invented. It was also done by Atari themselves, who did not have the same insight into the needs of multiprocess systems that DR had.

If Atari had defined the system from the start, I doubt if FMD_START would have existed at all, nor the entire rectangle system, since these were the inventions of DR. DR did not define a symmetrical pair of functions with the intention that one half of that pair be used separately. That is not consistent with their methodology.

Needless to say (but I will anyway), I regard DR (rather than Atari) as being the real authorities on all original GEM functions.

>RA>Using paired form_dial calls as described can not cause any problem at
>RA>all in a correct GEM implementation, as the FMD_FINISH call should
>RA>always result in window update messages for the entire surface of the
>RA>specified rectangle, or direct restoration of desktop background for
>RA>those parts of that surface not owned by any APP.
>
>form_dial() is a specification of an interface, not an implementation. And I
>don't believe that you can find a documentation of the used algorithm. That's
>simply because an interfacec is an abstraction from the algorithm behind it
>with the advantage that you can change the algorithm

I fully agree with what you say here. The form_dial specification as such does not include any details on how AES should be implemented. But we are not dealing with an isolated function when we really use form_dial in our programs. Then we are dealing with that function as implemented in the running AES, and therefore the implementation of other AES functions does matter.

Use

shel_write(1,1,100,...);

under MagiC and

shel_write(0,1,0,...);

under MiNT.

3283. Getting the resource where I want it.

Newsgroup: comp.sys.atari.programmer
Date: 1999-06-15 00:00:00 UTC
From: jesper.brannmark@swipnet.se
Message-ID: <37667a16.36305@nntpserver.swip.net>
Source record: 2702

Hi.

I'm working on a routine so that when I press my right mousebutton a menu will be engaged.

The menu is written as a dialogue in a RSC file.

I use the following GFA code to do this:

```
RSRC_LOAD (FILE)
RSRC_GADDR (0,0,adr%)
FORM_CENTER (adr%,x,y,b,h)
FORM_DIAL (0,x,y,b,h,,x,y,b,h)
OJBC_DRAW (adr%,0,2,x,y,b,h)
--- evnt_multi loop here ---
FORM_DIAL (3,x,y,b,h,x,y,b,h)
```

The problem is that it is centered - as form-center does, but I want it to appear where my mousek/mousey is placed.

Can anyone please help me with a better routine?

Here is where you need to insert the coordinate adjustments

>FORM_DIAL (0,x,y,b,h,,x,y,b,h)
>OJBC_DRAW (adr%,0,2,x,y,b,h)
> --- evnt_multi loop here ---
>FORM_DIAL (3,x,y,b,h,x,y,b,h)
>
>The problem is that it is centered - as form-center does, but I want
>it to appear where my mousek/mousey is placed.
>
>Can anyone please help me with a better routine?

I'd rather describe to you how to do it yourself, and in the long run
I'm sure you too will be much happier with a solution so achieved.

Note also that I am not so familiar with GFA coding, so I will use
C notation in my examples, and assume 16bit integer calculations
throughout. Adapting this to GFA will be up to you.

The essential needs are quite simple, in that you need to adjust the
coordinates calculated by form_center so as to match your mouse position
before you proceed with the first form_dial etc.

Now, the centered box is defined by (x,y,b,h) as used above, and I will
assume that you have some (mx,my) pair of variables for the mouse pos.

This means that the offsets you would have to add to (x,y) would be:

```
ox = mx-x-b/2;
oy = my-y-h/2;
```

But this will cause problems if the mouse is too close to a screen edge,
so it will have to be checked, and possibly limited towards the center.

So the simple calculation shown above is not suitable, and will be
replaced by better code incorporating the necessary checking.

In fact the form_center values for (x,y) are of no interest here, as we
really only care about (b,h) as it is these that represent the calculated
dialog size. (x,y) are only to be used as our new coordinate results.

To perform the check we also need variables for the limits, but those
values need to exclude the menu line, as dialog boxes are not allowed to
overlap the menu. Thus we must calculate the desktop work area.

So:

```
----- start of insertion -----
dummy = wind_get(0,4,&wx,&wy,&wb,&wh); /* calc desktop work area */
x = mx - b/2;
if ( x < wx ) /* wx 'should' be 0 but do it the generic way */
x = wx;
else
if ( (x + b) > (wx + wb) )
x = wx + wb - b;
y = my - h/2;
if ( y < wy )
y = wy;
else
if ( (y + h) > (wy + wh) )
y = (wy + wh) - h;
----- end of insertion -----
```

Translating the above to GFA syntax and inserting it at the point specified
above should give you the classical form of mouse centering limited so that
the entire dialog will always be visible on the legal part of the screen.

If the rez is to low for it, then the dialog will simply be based at the
first legal pixel in the work area.

which method shall I use to launch another application (from a GEM
application or ACC) that is executed in parallel.
I've tried shel_write(0, ...) and shel_write(1, 1, ...) (MagiC 6) but
nothing happend. I also tried shel_write(1, 0, ...) and then the GEM
application I wanted to launch was started as TOS process after my app
had finished, but this is clearly not the desired behaviour.
I'm wondering which method a desktop uses in a multi-task environment to
launch new applications, because this is exactly what I should use.

Hi!

In article <3765FCBA.FEEABF0B@jumpgates.com>,
Daniel Augsburger <skydiver@jumpgates.com> writes:
> I've tried shel_write(0, ...) and shel_write(1, 1, ...) (MagiC 6) but
> nothing happend.

Unfortunately, MagiC's way to launch applications in parallel is a bit
different to the way it's done for fully AES 4.x compatible systems.
IIRC, the first parameter has to be 1, the third(?) 100. The parameter
that decides whether to launch a GEM or TOS app has its usual meaning.

If you want, I can look it up.

Ciao

Thomas

Here some explanations of shel_write()
int shel_write(int mode,int flag1,int flag2,*commande, *tail)
mode&0xFF must be 1 for launch imediatly
if mode&0xFF00 !=0 commande use:
typedef struct _shelw
{
char *newcmd;
long psetlimit;
long prenice;
char *defdir;
char *env;
}
I not explain is use.
flag1 : 1 -> GEM program, 0-> TOS program (for use Tos2Win or VT52 the
output text in GEM window (work only if instal))
flag2 : 100 -> parrallel launch , 101 -> single mode
if multitasking system use 100 because 101 work differently beetween Mint
and Magic (it not stop for the end of sun prog under mint)
if you work under monotasking system prefer Pexec()
commande : string of program to lunch or SHELW struct (see mode)
tail : argument for program (attention first caractere is the number of
caracters in string if you use GCC if PureC I think PureC calculate it)
For more informations see:
http://www.utbm.fr/les.personnes/olivier.landemarre/exec.htm
it's in french sorry, but there is good traductors.
It work well and I use shel_write() for GCCShell

Hi Ronald!

RA>Because if every program was responsible for protecting the underlying
RA>surface of the screen for all their displays, then the entire system
RA>RAM would soon be used up for a lot of screen buffers,
Em, we are talking about form_dial(), aren't we?

RA>and for large resolutions the extensive buffer copying will consume
RA>more time than the overhead costs of a message system.
If you compare that, you have to add the time fr redrawing to the time the
message system needs and then the copying will be (much) faster

RA>The methods of GEM were designed especially to avoid such
RA>inefficiencies by requiring only that each APP be able to redraw the
RA>information for those windows that it owns, and that appropriate
RA>messages are sent to allow all APPs involved to do their parts of this
RA>work. The AES itself works as the message center for this update
RA>work, ensuring that all APPs are told to update only the relevant
RA>portions of the screen.
Yes, that's right

RA>The only exceptions (small dialogs, menus, popups) are for small areas
RA>of extremely temporary nature, where the savings would not motivate
RA>the overhead costs of the message system. (Could cause significant
RA>slowness)
Isn't a dialog (we're talking about modal ones) something extremely temporal?
The only important difference I can see ist that it can exceed the quarter
screen buffer. And this is only a technical limit that could be eliminated by
increasing the buffer size

RA>>Simple buffering of the entire screen is not a part of this
RA>>concept.
JW>No one's talking about the whole screen (in general)
RA>But that was the subject of the original post. How to cause GEM to
RA>refresh the entire screen !
Yes, but this buffering of the whole screen could only occure, if you call a
pair of form_dial()s for refreshing the whole screen (or if you have a dialog
that has the extend of the screen)

RA>And for that particular purpose it is definitely wrong for any part of
RA>the system to implement it by a simple buffering scheme.
That's a reason why I say you shloud use a single form_dial() for refreshing
the whole screen

RA>Because they concern so small and temporary screen usage that their
RA>incorporation in the rectangle lists would cause an unwarranted and

RA>overly large overhead.
The larger size of a dialog (compared to an alert, drop down menu or popup) doesn't make the redrawing method faster than buffering. And the memory usage for buffering can be limited to the memory for 1 screen

RA>Proper reservation of update rectangles is meaningful regardless of
RA>what scheme is used to restore the surface content later, and that is
RA>why DR included it. To keep the interface symmetrical and avoid
RA>dependency on any particular internal redraw implementation.
Yes, and the task of form_dial(FMD_START); [...] form_dial(FMD_FINISH); is to restore the content of the screen/rectangle when doing the form_dial(FMD_START), isn't it?

RA>They did not want to impose any limits for the future, this is true,
RA>but I doubt that they considered simple buffering schemes suitable.
They did it for alerts and other things. Why shouldn't they do it for dialogs?
The only reason I can think of is the larger buffer that could be needed, which IMO is no real reason when having a machine with some megabytes

RA>They were much more aware of multiprocess needs than Atari were,
Yes, I think so too

RA>Those threats were not realistic, as Apple didn't really have a solid
RA>case (like I said, they had stolen most ideas too), but DR could not
RA>afford even a case they would win, so they backed down. That is why
RA>GEM developments were frozen for so many years, until Atari managed
RA>to 'mollify' Apple, who were no longer worried about PCs being given
RA>GEM to outcompete McIntosh (as DR had originally planned).
That's not correct.
Apple threatened DR with the lawsuit after DR has sold a version of GEM to Atari. That's the reason why Atari had a "good" desktop while PC-GEM got a crippled one

RA>That is not really relevant. As RAM size increases at lowered prices,
RA>the screen resolution sizes also rise, making 'simple buffering' as
RA>unsuitable today as when GEM was newborn.
But the size of the programs won't increase in the same extent. And as I said above: one buffer would be enough

RA>The same (in a very different context) goes for FMD_START and
RA>FMD_FINISH. The latter is used to finish a graphic process, so that
RA>the screen can be restored to what it should be (according to AES and
RA>all GEM APPs), and it is not sensible to finish something that was
RA>never started.
That's why I call the single form_dial() a hack. But it's a working one

RA>You mean 'inconsistent' in english. 'Inconsequent' is not a useful
RA>form, and the closest useful one ("inconsequential") does not have the
RA>same meaning as the german word you were probably thinking of.
Well, according to my dictionary 'inconsequent' and 'inconsistent' both mean the same

RA>Yes, but I would hesitate to call this a bug.
If an AES extension relies on a not explicitly documented relation between two calls and if it's not error resistant it IMO has a bug

RA>What I referred to here was direct restoration from a screen buffer
RA>into screen areas owned by some other APP. That would be quite
RA>illegal.
Why should it be illegal if the application is not able to change the content of the window inbetween?

RA>The fact remains that used as I recommend, the function will not cause
RA>any known software to misbehave,
Sorry, but you're wrong here. There are extensions that use the form_dial() calls to buffer/restore the background and with this extensions your recommendation will not cause a redraw

RA>And that 'hack' was written at at time when the current multitasking
RA>systems (not to mention their extensive enhancements) had not even
RA>been invented. It was also done by Atari themselves, who did not have
RA>the same insight into the needs of multiprocess systems that DR had.
The hack is to document the usage of a call in a way that could formerly considered to be a bug, to get a new feature and exploiting the implementation in older versions to assure compatibility

RA>If Atari had defined the system from the start, I doubt if FMD_START
RA>would have existed at all, nor the entire rectangle system, since
RA>these were the inventions of DR. DR did not define a symmetrical pair
RA>of functions with the intention that one half of that pair be used
RA>separately. That is not consistent with their methodology.
I think so too

RA>Needless to say (but I will anyway), I regard DR (rather than Atari)
RA>as being the real authorities on all original GEM functions.
Yes, but DR never said anything about how to redraw the whole screen

RA>Then we are dealing with that function as implemented in the running
RA>AES, and therefore the implementation of other AES functions does
RA>matter.
You are relying on the implementations you know. That's dangerous

Bye

Joerg

>Em, we are talking about form_dial(), aren't we?

Yes and no.

Yes: We are talking of the form_dial function.
No: We were not really talking of its normal use in connection to forms.
Instead we were talking only of the correct way to use it in causing
a full screen redraw. That was what the original query concerned.
But discussions of this kind always tend to 'wander' a bit.

>RA>and for large resolutions the extensive buffer copying will consume
>RA>more time than the overhead costs of a message system.
>
>If you compare that, you have to add the time fr redrawing to the time the
>message system needs and then the copying will be (much) faster

Faster for most cases, but not necessarily correct. What should be redrawn
by a GEM APP at any given time is only up to that APP, not to the content of
any buffer. This is especially relevant to the kind of situation addressed
by the query, where the original screen data had been corrupted by non-GEM
operations.

>RA>The only exceptions (small dialogs, menus, popups) are for small areas
>RA>of extremely temporary nature, where the savings would not motivate
>RA>the overhead costs of the message system. (Could cause significant
>RA>slowness)
>
>Isn't a dialog (we're talking about modal ones) something extremely temporal?

Now I see your mistake. You thought we were discussing the normal usage of
the function in handling forms, but that was not the case. For such uses,
and for moderately sized dialog forms, I do agree with you, but only for
situations where the AES is in total control, so that no complexities can
occur that affect the validity of the buffering. That is often not so.

Also, if we are to discuss dialogs in general, then I will not restrict
myself to the modal ones. On a modern TOS machine both modal and non-modal
dialogs must coexist.

>The only important difference I can see ist that it can exceed the quarter
>screen buffer. And this is only a technical limit that could be eliminated by
>increasing the buffer size

But that can only be done safely by some TSR, not by a normal APP, and it is quite inapproprioate for any APP to use that buffer anyway, as it may already hold data placed there by the AES. Code outside of the AES should only access that pointer in order to enlarge the buffer, and that should only be done by a TSR. That is ok for a GEM enhancer, which is normally installed as a TSR anyway.

>RA>>Simple buffering of the entire screen is not a part of this
>RA>>concept.
>JW>No one's talking about the whole screen (in general)
>RA>But that was the subject of the original post. How to cause GEM to
>RA>refresh the entire screen !
>
>Yes, but this buffering of the whole screen could only occure, if you call a
>pair of form_dial()s for refreshing the whole screen

No, on no version whatever of TOS has that led to such a consequence. What I meant was simply that if you want buffering to replace AES redraw messages, like you seem to want, then the entire screen must exist in a buffer for cases like this one.

The query did ask for how to refresh the entire screen, in the most legal manner, and to me that means using form_dial calls properly paired.

>(or if you have a dialog that has the extend of the screen)

With your suggested method that would have such an effect too, but with normal TOS methods that will not happen. And the same is true of MTOS, Geneva, NAES, and MagiC. I'd say that a rather strong consensus exists in favor of the message-based redraw method among the implementors, and I heartily agree with them. It is a superior method.

>RA>And for that particular purpose it is definitely wrong for any part of
>RA>the system to implement it by a simple buffering scheme.
>
>That's a reason why I say you shloud use a single form_dial() for refreshing
>the whole screen

I disagree. I think form_dial calls should be used in symmetrical pairs.

>RA>Because they concern so small and temporary screen usage that their
>RA>incorporation in the rectangle lists would cause an unwarranted and
>RA>overly large overhead.
>
>The larger size of a dialog (compared to an alert, drop down menu or popup)
>doesn't make the redrawing method faster than buffering.

I never said so. What I spoke against was waste of RAM, and the inability to restore screen data after it has been corrupted. Simple buffering schemes can worsen the situation they should help, if corrupted data ends up in the

buffer. The message system is immune to all such effects.

>And the memory usage for buffering can be limited to the memory for 1 screen

We can implement a new system of rectangle lists in parallel to the one
already existing, but administrating them will not be instantaneous,
and the effect will not be as great as you think, as buffered areas can
overlap, and it must be possible to restore intermediate screen states.

Also, what this will mean is that we implement a centralized redraw system,
otherwise very similar to what we have, except that the individual APPs are
not asked to confirm that the data is valid. It is just taken from a buffer.

This means that when any screen part has become corrupted it can stay so,
even where the present system would have fixed it, as any corrupted data
that has made it into the buffer would be used to redraw the screen.
Only the APP that owns such a screen area can restore it properly.

>RA>Proper reservation of update rectangles is meaningful regardless of
>RA>what scheme is used to restore the surface content later, and that is
>RA>why DR included it. To keep the interface symmetrical and avoid
>RA>dependency on any particular internal redraw implementation.
>
>Yes, and the task of form_dial(FMD_START); [...] form_dial(FMD_FINISH); is to
>restore the content of the screen/rectangle when doing the
>form_dial(FMD_START), isn't it?

Essentially yes, but that is not the whole story. What should be restored is
not necessarily what did reside in the screen RAM at that time, but what the
AES and the GEM APPs would have *liked* to have on the screen.

A pure buffering scheme can not deal with that difference, but the message
system of GEM can. It will redraw the screen correctly regardless of what
corruption may have existed in the past. That is a very great strength.

>RA>They did not want to impose any limits for the future, this is true,
>RA>but I doubt that they considered simple buffering schemes suitable.
>
>They did it for alerts and other things. Why shouldn't they do it for
>dialogs?

They did it for things were AES itself is in full control of the operation.
That is not the case for dialogs handled by an APP. FMD_START itself does
not freeze the screen updating (and shouldn't do so).

In order for simple buffering to be valid, it is necessary that no other
APP can draw anything on that screen area until it has been restored from
the buffer again. AES imposes that rule for the menus, and alerts, so
they are never a problem (as long as GEM rules are obeyed by APPs), but
there is no way to impose such a rule for the general dialogs of multitasked
APPs. (or singleTOS ACCs)

>The only reason I can think of is the larger buffer that could be needed,

That is another valid reason, but the main reason is given above.

>which IMO is no real reason when having a machine with some megabytes

Perhaps, but if such buffering is done by many APPs at the same time,
which happens here now and then, the amounts of RAM used would grow.

----- snip ----- re: DR, their plans, and the threats that stopped them

>RA>Those threats were not realistic, as Apple didn't really have a solid

>RA>to 'mollify' Apple, who were no longer worried about PCs being given
>RA>GEM to outcompete McIntosh (as DR had originally planned).
>
>That's not correct.
>Apple threatened DR with the lawsuit after DR has sold a version of GEM to
>Atari. That's the reason why Atari had a "good" desktop while PC-GEM got a
>crippled one

What you are saying is naturally true, but I don't see how it contradicts
what I told of. DR were already converting the code for PC use, when
Apple grew aware of what was happening, and they told DR to remove some
of the abilities of the PC version 'or else'. So DR removed the concept
of free numbers of freely movable windows, thus making PC-GEM useless.
(Compared to Atari GEM.)

It was the sale of GEM to Atari that drew Apple's attention to it, but it
was the plan to implement the same thing for PCs that scared Apple into
a fit. It would have been very interesting to see what would have happened
if DR could have afforded to 'call the bluff' of Apple, and go on to give
PCs a fully capable GEM, at a time when the main M$ products were still a
simple BASIC interpreter, and a badly botched early MSDOS.

>RA>That is not really relevant. As RAM size increases at lowered prices,
>RA>the screen resolution sizes also rise, making 'simple buffering' as
>RA>unsuitable today as when GEM was newborn.
>
>But the size of the programs won't increase in the same extent.

I never mentioned program size. I spoke of the RAM size needed for storage
of screen data in high resolutions.

>And as I said above: one buffer would be enough

No. Think about it. The total area needed for restoration of the screen
as it looked at one given point in time is only one full screen buffer.
But various parts of the screen may have been reserved at different times,
and it is perfectly legal for the areas to overlap. The only good way to
deal with that is to have the dialogs in windows, and use the AES messages
to restore window contents. That is the only method I know of that can
deal with successive redraw of all intermediate screen states.

A similar method could be designed based on buffering, rather than on asking each APP to regenerate the data, but there would be many drawbacks to it, not least the complexity of that code (a new rectangle system), and the inability to avoid buffering any screen corruption that may have occurred.

>RA>The same (in a very different context) goes for FMD_START and
>RA>FMD_FINISH. The latter is used to finish a graphic process, so that
>RA>the screen can be restored to what it should be (according to AES and
>RA>all GEM APPs), and it is not sensible to finish something that was
>RA>never started.
>
>That's why I call the single form_dial() a hack. But it's a working one

But what is the problem you see in using the paired form ?
That too works excellently, and it does work with utilities that are 'allergic' to the unpaired form. I still don't see your point.

You seem to want someone to reinvent GEM to use only buffering instead of redraw messages, and it seems to be for this reason that you want to reserve FMD_START for use only in saving buffer data.

I, on the other hand, do not think this will ever happen, and would not be in favor of such an implementation anyway. The present one is better.

>RA>Yes, but I would hesitate to call this a bug.
>
>If an AES extension relies on a not explicitly documented relation between
>two calls and if it's not error resistant it IMO has a bug

All AES enhancements invented since Atari stopped developing are also undocumented by their 'official' documents, and no software at all can be completely resistant to errors, but I hesitate to call them bugged even so.

In this particular case I do consider the tie between FMD_START and FMD_FINISH to be implicitly clear, even if not explicitly stated.

>RA>What I referred to here was direct restoration from a screen buffer
>RA>into screen areas owned by some other APP. That would be quite
>RA>illegal.
>
>Why should it be illegal if the application is not able to change the content
>of the window inbetween?

And how do you know that, considering that reservations can overlap, and we do have multitasking (even under singleTOS, for the ACCs) ? The answer is that it can only be known for some special cases, but not for all cases. For those other cases it is is illegal, and since they can't be recognized easily the method as such is inappropriate.

>RA>The fact remains that used as I recommend, the function will not cause
>RA>any known software to misbehave,
>
Sorry, but you're wrong here. There are extensions that use the form_dial()

>calls to buffer/restore the background and with this extensions your
>recommendation will not cause a redraw

Aha, so we have two conflicting groups of enhancers. One which does use
the message system of GEM compatibly, and one which disables part of it,
so that messages are no longer generated for paired form_do's, but only
(very inconsistently) for unpaired form_do(FMD_FINISH...)

I consider the latter implementation inconsistent and inappropriate,
and I see many situations where it will not do its job correctly. Its
main strength is that it can help some badly written old APPs that lack
proper redraw capability (like many old APPs do) to work a little better
when other programs open dialogs on top of them.

But the same goal could be achieved without mutilating the consistency
of form_dial.

>RA>And that 'hack' was written at at time when the current multitasking
>RA>systems (not to mention their extensive enhancements) had not even
>RA>been invented. It was also done by Atari themselves, who did not have
>RA>the same insight into the needs of multiprocess systems that DR had.
>
>The hack is to document the usage of a call in a way that could formerly
>considered to be a bug, to get a new feature and exploiting the
>implementation in older versions to assure compatibility

What you have described above is not what I consider compatibility.

Also, you yourself rely on an undocumented assumption that you evidently
consider implicit to what Atari said (though I disagree).

Just because Atari said that a single FMD_FINISH call will broadcast the
messages, you seem to have assumed that paired ones shouldn't.

Actually the natural implication is the opposite. The statement that the
use of a single FMD_FINISH call will broadcast the messages doesn't exclude
the possibility that it was preceded by an FMD_START call. Thus it is very
clear that the FMD_FINISH calls should always result in redraw messages for
the given rectangle, regardless of whether they are paired with a preceding
FMD_START call or not.

>RA>Needless to say (but I will anyway), I regard DR (rather than Atari)
>RA>as being the real authorities on all original GEM functions.
>
>Yes, but DR never said anything about how to redraw the whole screen

AFAIK that is true, but then, they didn't 'stay with us' very long,
and they didn't foresee all future needs, though they were good at it.

>RA>Then we are dealing with that function as implemented in the running
>RA>AES, and therefore the implementation of other AES functions does
>RA>matter.
>
>You are relying on the implementations you know. That's dangerous

No, you exaggerate.
Relying on the fact that a paired use of FMD_START and FMD_FINISH will
redraw the specified area can never ever cause any harm at all. The
very worst thing that can happen, and even that only with the extensions
you mentioned, is that the area does not get redrawn as it should.
That is not what I call 'dangerous'.

Hi Ronald!

RA>Now I see your mistake. You thought we were discussing the normal
RA>usage of the function in handling forms, but that was not the case.
What was the case then?

RA>For such uses, and for moderately sized dialog forms, I do agree with
RA>you, but only for situations where the AES is in total control, so
RA>that no complexities can occur that affect the validity of the
RA>buffering. That is often not so.
Example?

RA>Also, if we are to discuss dialogs in general, then I will not
RA>restrict myself to the modal ones. On a modern TOS machine both modal
RA>and non-modal dialogs must coexist.
We're talking about form_dial() and therefore about modal dialogs. There
certainly are unmodal dialogs, but you don't need form_dial() for them so
that they are not relevant here

RA>But that can only be done safely by some TSR, not by a normal APP, and
RA>it is quite inapproprioate for any APP to use that buffer anyway, as
RA>it may already hold data placed there by the AES.
I thought about increasing the buffer by the AES programers

RA>Code outside of the AES should only access that pointer in order to
RA>enlarge the buffer, and that should only be done by a TSR. That is ok
RA>for a GEM enhancer, which is normally installed as a TSR anyway.
Is there such a pointer?
Well, that doesn't matter because I think that no application has to deal
with it

RA>No, on no version whatever of TOS has that led to such a consequence.
What not is can never be?

RA>What I meant was simply that if you want buffering to replace AES
RA>redraw messages, like you seem to want, then the entire screen must
RA>exist in a buffer for cases like this one.
The entire screen must fit in the buffer, yes

RA>The query did ask for how to refresh the entire screen, in the most
RA>legal manner, and to me that means using form_dial calls properly
RA>paired.
I know. And you know that and why I disagree with you in that point

RA>With your suggested method that would have such an effect too, but
RA>with normal TOS methods that will not happen. And the same is true of
RA>MTOS, Geneva, NAES, and MagiC.

I know that no currently available OS implements the buffering method

RA>I'd say that a rather strong consensus exists in favor of the message-
RA>based redraw method among the implementors,
These method needs no memory for a buffer and since all these operating
systems have to be able to run no machines with 512KB or 1MB they have to
take care about the memory usage of the system

RA>It is a superior method.
No.
That clearly depends on the point of view (what's more important to you,
spped or low memory usage)

RA>What I spoke against was waste of RAM, and the inability to restore
RA>screen data after it has been corrupted.
And how do you restore "corupted data" if you have no dialog?
Sorry, but this argument is really silly

RA>Simple buffering schemes can worsen the situation they should help,
RA>if corrupted data ends up in the buffer.
Can you explain how that could happen?

RA>We can implement a new system of rectangle lists in parallel to the
RA>one already existing, but administrating them will not be
RA>instantaneous, and the effect will not be as great as you think, as
RA>buffered areas can overlap, and it must be possible to restore
RA>intermediate screen states.
Since when is it possible to nest form_dial()?
And how could that work with the redraw mehtod?

RA>This means that when any screen part has become corrupted it can stay
RA>so, even where the present system would have fixed it, as any
RA>corrupted data that has made it into the buffer would be used to
RA>redraw the screen.
Please tell me how corrupted data can originate and how the can make it into
the buffer

RA>What should be restored is not necessarily what did reside in the
RA>screen RAM at that time, but what the AES and the GEM APPs would have
RA>*liked* to have on the screen.
In this case the result is a restore from the buffer with a following redraw
induced by the AES or App. This rare case might be not optimal, but there's
no problem with that

RA>FMD_START itself does not freeze the screen updating (and shouldn't do
RA>so).
Yes it's not neccessary (but won't hurt) because you first have to lock the
screen with wind_update() before doing your dialog stuff

RA>In order for simple buffering to be valid, it is necessary that no
RA>other APP can draw anything on that screen area until it has been
RA>restored from the buffer again. AES imposes that rule for the menus,
RA>and alerts, so they are never a problem (as long as GEM rules are

RA>obeyed by APPs), but there is no way to impose such a rule for the
RA>general dialogs of multitasked APPs. (or singleTOS ACCs)
Just embrace your dialog stuff with wind_update(). This ensures that no other app draw onto the screen while your dialog is displayed

RA>Perhaps, but if such buffering is done by many APPs at the same time,
RA>which happens here now and then, the amounts of RAM used would grow.
Many apps display modal dialogs at the same time?
I've never seen that. And I don't believe you have

RA>So DR removed the concept of free numbers of freely movable windows,
Only in the desktop. The apps continued to have movable windows

RA>I never mentioned program size. I spoke of the RAM size needed for
RA>storage of screen data in high resolutions.
Yes. And I mentioned another thing memory is used for (the programs) to show that the relations between the amounts of memory used for the different tasks changes when the total memory size increases

RA>No. Think about it. The total area needed for restoration of the
RA>screen as it looked at one given point in time is only one full screen
RA>buffer.
Since there can be only one modal dialog at a time and form_dial() cannot be nested, a buffer of 1 screen size is enough. Think about it

RA>But what is the problem you see in using the paired form ?
Aren't you reading my mails?

RA>You seem to want someone to reinvent GEM to use only buffering instead
RA>of redraw messages, and it seems to be for this reason that you want
RA>to reserve FMD_START for use only in saving buffer data.
I said:
FMD_START _could_ be used to save the dialog background and FMD_FINISH with a foregoing FMD_START to restore the saved background

RA>All AES enhancements invented since Atari stopped developing are also
RA>undocumented by their 'official' documents,
No comment to this "argument"

RA>In this particular case I do consider the tie between FMD_START and
RA>FMD_FINISH to be implicitly clear, even if not explicitly stated.
For normal use you're right, but redrawing (the wohl screen) is not the normal use

RA>considering that reservations can overlap
They cannot if you do not nest dialogs and nesting dialogs will not work with the redraw method, too

RA>Just because Atari said that a single FMD_FINISH call will broadcast
RA>the messages, you seem to have assumed that paired ones shouldn't.
You do not want to understand me, do you?
I never said paired ones shouldn't broadcast redraws. I said it is possible that there will not be a broadcast of a redraw message

RA>Actually the natural implication is the opposite. The statement that
RA>the use of a single FMD_FINISH call will broadcast the messages
RA>doesn't exclude the possibility that it was preceded by an FMD_START
RA>call. Thus it is very clear that the FMD_FINISH calls should always
RA>result in redraw messages for the given rectangle, regardless of
RA>whether they are paired with a preceding FMD_START call or not.
You seem to have understand nothing

RA>That is not what I call 'dangerous'.
Replace it with 'likely to produce problems' if you like

Hi Jï¿½rg,

Having read your post fully I can only come to the conclusion that this our discussion is no longer productive.

The fact that we have different opinions on how some system functions should best be used should not be taken 'personally' by either party, and it seems clear to me that you have taken it so, from some of your responses.

I'm not going to answer in kind, as I still have not taken it as you, but I will mention here, that saying that my arguments are silly, that I don't want to understand you, and that I have understood nothing, is not a good way to clarify anything. And it does mean that further discussion is not meaningful.

There have been misunderstandings on both sides in earlier posts, and there are some in your latest one too, where you misquote something I said into something I did not mean, and then say that my argument was silly. I am prepared to assume that all misunderstandings by both of us were honest ones, but it seems that you are not prepared to do so, and then nothing can be achieved by further discussion.

Also, my original post on this subject was intended merely as some quick advice to a guy with a problem. Somehow this has now developed into a lengthy debate of a kind I never wanted, and really have no time for.

I'm not thereby saying that I disregard all your arguments, for many of the points you made were valid. But some other 'points' you made were merely directed at your mistaken idea of what I meant, rather than against what I really intended. In some of those cases we probably even agree on the real facts, though our different ways of expressing them causes these misunderstandings to hide such agreement.

Possibly it would be better to discuss these things again at some future date, when we have both figured out how to express what we mean clearly enough to avoid the frequent misunderstandings that have affected this present discussion many times.

I suggest that we cut this thread for now, as I'm sure we both have better things to do than to discuss this stuff over and over. It is quite clear in any case, regardless of all the other issues brought up, that you and I disagree completely on the paired/unpaired use of form_dial, and that neither of us is likely to change his view on that subject. For either of us to attempt to 'convert' the other would merely be wasted time.

I can accept that situation as it stands, and I hope you can to.

Hi Ronald!

RA>Having read your post fully I can only come to the conclusion that
RA>this our discussion is no longer productive.
That's my impression too

RA>The fact that we have different opinions on how some system functions
RA>should best be used should not be taken 'personally' by either party,
RA>and it seems clear to me that you have taken it so, from some of your
RA>responses.
I have not taken anything personal.
My partly offending answers are a result of some comments/arguments from you
that either had nothing to do with what we were talking about, were unlogical
or just stating your point of view again with ignoring what I've said which
lengthens the discussion without being of any use. And I have more importsant
things to do than superfluous discussions

RA>saying that my arguments are silly, that I don't want to understand
RA>you, and that I have understood nothing, is not a good way to clarify
RA>anything.
I got the impression that you are not interested in a clarification

RA>Also, my original post on this subject was intended merely as some
RA>quick advice to a guy with a problem.
i did so too and I also mentioned a possible problem of your quick advice and
how to make it better

RA>Somehow this has now developed into a lengthy debate of a kind I never
RA>wanted, and really have no time for.
Same with me

RA>But some other 'points' you made were merely directed at your mistaken
RA>idea of what I meant, rather than against what I really intended.
I cannot guess your intention

From: Marcel De Meester <mdemeester@village.uunet.be>
Message-ID: <929989960-324601AEicMi@village.uunet.be>
Source record: 2712

Hello,

I have troubles installing GNU C++. I have the 'SDK Atari Software Developement Kit - Upgrade 1999' CD-rom, with GNU C++ on it. I'm not using Mint, so I suppose I have to use version 2.72. There is a folder on the CD named 'GCC272'. I've copied it and unpacked everything. But when I try to compile something, the compiler says he can't find the include files. So I searched on the CD and I found the folder 'G'. I unpacked the file 'GPINCL20.ZIP' to my harddisk. After setting the right path in 'AGNUS', a development environment, the compiler finds some of the include files, but he can't find others. Sometimes, I get errormessages in the include-files.
Does anyone know a solution for this? What am I doing wrong??

Thanks in advance,

Wim De Meester

It did, and the manuals were on sale at one of the Atari shows many years ago from Prospero themselves at a knock-down price. I know, for I bought a set.

Hi!

I'm writing an program, which uses dynamic variables (structures). I'm using PureC
and standard Falcon with 16MB.
It's a database of word (dictionary). But...
Loading goes very well. But when I'm looking through the database the computer
takes memory. Why??

OK. I'll try to explain it a little...In my program I have structures like:

```
typedef struct options{
int i;
char *name;
....
struct options *next;
struct options *prev;
}options;
```

Loading goes like this:

```
struct options *start_bla, *end_bla;
{
struct options *bla;

bla = Malloc(sizeof(options));

start_bla = bla;
..... /* Loading functions - works fine */
end_bla = bla;
}

void search(void)
{
struct options *bla;

bla = start_bla;

while(bla!=end_bla)
{
if(strcmp(bla->name,....)
/* something */
```

```
else
bla = bla->next; !!!!!!!
}
....
}
```

It's only an idea of my program. Is it enough.
OK. While executing function 'search' computer uses more and more memory!!!!

BTW. How can I subscribe this list (give the email adress)?

Thanks

I am very sorry, but your examples do not look like something that really has run in a computer. ;-)

The following though can be said:
Malloc's effect is !NOT! block structured. The pointer will disappear at the end of a block, the allocated memory will remain allocated and becomes inaccessible. Before leaving a block, you must explicitly 'free' the allocated memory, by Free(bla), if bla is a local variable within the block.

In general every 'malloc'd chunk must always be explicitely 'free'd.

Another very important advice is: Use malloc for small pieces, not Malloc.
Malloc is a system call, malloc a library call.
malloc is faster and reduces chances of heap fragmentation.
The opposite of malloc is free. :-)

Henk

3305. Need a binding for appl_search()

Newsgroup: comp.sys.atari.programmer

I found the following in MT_AES.H (A. Kromke himself)

WORD appl_search(WORD mode, char *name, WORD *type, WORD *id);

control[]={18,0,1,0,0}

which is probably wrong and should be

control[]=18,1,3,1,0}

intin[0]=mode
addrin[0]=name

call the aes in a suitable manner ....

*type=intout[1]
*id=intout[2]

return intout[0]

Sometimes I wonder...

We go to great lengths to fill in all those "no of entries in ..." in control[]
Are these really checked, or even used?

Greetings
Henk

Hi Lonny!

LP>I need a functional binding for appl_search()
LP>Anyone have one, or can point to some place to find the proper binding?
This one is from my own AES binding I use for my TSRs. The parameter aespb is
only used to for setting the global array (which I need in the TSRs).
Normally you won't need that unless your binding shall be reentrant...

-------------------------------- >8 schnipp 8<
--------------------------------
extern int applsearch_control[]; /* = { 18, 1, 3, 1, 0} */

int appl_search(AESPB *aespb,
int ap_mode, char *ap_name, int *ap_type, int *ap_id)
{
AESPB aes_pb;
int intin[1];
void *addrin[1];
int intout[3];

intin[0] = ap_mode;
addrin[0] = ap_name;

aes_pb.pb_control = applsearch_control;
aes_pb.pb_global = aespb->pb_global;
aes_pb.pb_intin = intin;
aes_pb.pb_intout = intout;
aes_pb.pb_addrin = addrin;
aes_pb.pb_addrout = NULL;

_aes(&aes_pb);

*ap_type = intout[1];
*ap_id = intout[2];

return(intout[0]);
}
-------------------------------- >8 schnapp 8<

Hi Henk!

HR>control[]={18,0,1,0,0}
HR> which is probably wrong
It's definitively wrong

HR>and should be
HR> control[]=18,1,3,1,0}
Correct

HR>We go to great lengths to fill in all those "no of entries in ..." in
HR>control[]
Pushing 5 ints at each call is really nothing.

HR>Are these really checked, or even used?
They are needed to for call extensions. for example Atari could have used the
function number of fsel_input() to implement fsel_exinput(). They only had to
check wether there is the additional parameter in the addrin array.
And with setting of the values for the output arrays you tell the system the
minimum size of the array. If a call's return values are extended by some new
ones the system can determine wheter it is allowed to place these values
there

The only problem with that is, that there are many bindings that do not
properly fill the control array. But that's no reason not to do it correctly

Bye

Your descriptions is a bit vague!

Basically, if you use dynamically allocated variables then the space
is obtained from the system free memory. If you are using GemDos
Malloc each call should be noticable with a memory watching tool,
whereas if you're using stdio malloc/calloc/realloc then for
performance reasons they only tend to do a Malloc every so often (when
they have to).

Now, if your program is slowly (or not so slowly) eating away at the
free memory without reaching a kind of "maximum" then it most likely
has a memory leak. This is nothing more complex than your code has
allocated memory and hasn't deallocated it when done with it.

This will leak...

```
typedef struct {
char *search_text;
...
} DB_SEARCH_REC;

DB_SEARCH_REC*
SearchDataBase(char name[])
{DB_SEARCH_REC *dbr;

/* no error checking for clarity! */
dbr = malloc(sizeof DB_SEARCH_REC);
dbr->search_text = strdup(name);

/* do search */

return dbr;
}
```

```
int
SearchMyList()
{char *list[] ={"fred","jim","bob",NULL};

for (i = 0; list[i]; i++) {
if (SearchDataBase(list[i])) return 1;
}
return 0;
}
```

...whereas this doesn't...

```
int
SearchMyList()
{char *list[] ={"fred","jim","bob",NULL};
DB_SEARCH_REC *p;

for (i = 0; list[i]; i++) {
if (NULL != (p = SearchDataBase(list[i]))) {
free(p->search_text);
free(p);
return 1;
}
free(p->search_text);
free(p);
}
return 0;
}
```

I used strdup() because it is one function that uses malloc. It is up to you to free() it when done. There aren't many of them (tmpnam etc are the only others I can think of offhand) but do make a point of checking the docs on functions that give you data "out of thin air" iyswim!

Hope that gives you an idea of what to look for. ;-)

Hi!

In article <37736084.87617BC2@elektryk.ie.pwr.wroc.pl>,
Rafal Kawecki <kawecki@elektryk.ie.pwr.wroc.pl> writes:
> bla = Malloc(sizeof(options));

Better use the library's malloc(), not the GEMDOS function. TOS's GEMDOS has a limited pool of memory handles, so calling Malloc() too often can cause it to stop with an error message. Under MiNT, with active memory protection, each call to Malloc() allocates a block that fits a 8k boundary (the page size used), so Malloc(1L) will actually allocate 8K.

The C library's malloc() allocates larger chunks via Malloc() and then uses an internal management to split these into the blocks requested by the user.

> OK. While executing function 'search' computer uses more and more
> memory!!!!

Well, as your search function itself does not contain any [Mm]alloc()-calls, there's either another part in your program that does so, or the implementation of strcmp() in your C library is totally broken.

Have you tried tracing the GEMDOS calls via Sys-Mon, to see if, when, and which process calls Malloc()?

> BTW. How can I subscribe this list (give the email adress)?

As Nicholas already pointed out, this is a newsgroup, not a mailing list. If you want answers, read them here, there's no need to subscribe anything but comp.sys.atari.programmer in your newsreader (apparently Netscape Communicator). Asking for private replies only is commonly disliked in the UseNet, btw.

Ciao

Thomas

What you mean broken?This part with Malloc() is used only ones (at the
beginning of my program).

> Have you tried tracing the GEMDOS calls via Sys-Mon, to see if, when,
> and which process calls Malloc()?

Yes. I used PureDegugger, and I know that malloc is called only on start.

Thanks

Rafal Kawecki

3314. Geneva and running non-GEM apps with Pexec

Newsgroup: comp.sys.atari.programmer
Date: 1999-06-28 00:00:00 UTC
From: josdb@xs4all.nl
Message-ID: <37775628b814c0@xs4all.nl>
Source record: 2731

I'm having problems launching .TTP and .TOS programs with Pexec from within a GEM application under Geneva. The programs run fine and the GEM application returns correctly, but after that, any attempt to run a program from the desktop results in a severe crash. I don't have that problem when launching another GEM application, so I must be doing something wrong when clearing the screen etc. that causes a GEM error.

This is what I do:

```
v_hide_c(vdi_handle);
graf_mouse(M_OFF,0); /* to make sure */
v_clrwk(vdi_handle);
v_enter_cur(vdi_handle);
appl_exit();

Pexec(0,prg,param,env);

ap_id=appl_init();
v_exit_cur(vdi_handle);
v_show_c(vdi_handle,0);
graf_mouse(M_ON,0);
```

It only causes problems under Geneva.

```

If it is plain TOS applications you are starting you do not need
to do appl_exit().

If you like to keep the appl_exit do it like this:

graf_mouse(M_OFF,NULL);
v_clrwk(vdi_handle);
appl_exit();

Pexec(0,prg,param,env);

ap_id=appl_init();
graf_mouse(M_ON,NULL);

Someone may give you better advice, but for dynamic memory allocation
why not use calloc instead of Malloc. That's what it is designed
for. Then use "free" to release that memory when you are done with
it. That always works fine for me.

I'm not at all sure about entering and exiting text mode! I have a
philosophy - the less code you write, the less there is to go wrong.
Why not...

```
graf_mouse(M_OFF);
Pexec()
graf_mouse(M_ON);
```

...? ;-)

Source record: 2735

Hi!

Thanks for all suggestions.
The real problem was STRDUP.
It uses the malloc function and now I solved that problem :)
After using strdup I have to use free() or instead of strdup
it is possible to use strcpy.

Read again. I wrote that either your library's strcmp() function must be
broken (as it seems to call Malloc()), or you haven't really shown as
all the code or how it's actually (going to be) used.

> Yes. I used PureDegugger, and I know that malloc is called only on start.

Pure Debugger is not the right thing to use here for the first stage,
you need a system monitor that traces GEMDOS calls, first. Furthermore,
what you "know" is not what really happens, so an inspection with e.g.
Sys-Mon should help to track the problem down.

Ciao

Thomas

Thaks again for all your suggestions.
The real problem was the function STRDUP, because it uses malloc().
Now I know how to solve the problem.
Ones again thank you very much.

3321. GEM Programming Contest

Newsgroup: comp.sys.atari.programmer
Date: 1999-07-01 00:00:00 UTC
From: Bengy Collins <collins@bulli.com>
Message-ID: <rEze3.1000$k3.73893@news1.telusplanet.net>
Source record: 2738

Hello all, on advice from Tony Greenwood, who told me this is where this message belongs, here is information about the the first anual MGC99.

The Goal:

The goal is to create the best possible conversion of a classic game. Possible conversions can range from Asteroids to Elite Frontier. Some examples for real classics can be found at http://bengy.atari.org/list.htm. The catch is however, that the game must be created to run perfectly under MagiC (TOS/MiNT support of course not excluded) in a GEM window.

The judges will be the Atari community. All entries will be available for download on December 5th, 1999. At this time, voting sheets will be made available to the general public. The winner(s) will be notified on Christmas Day, December 25th, 1999. This means that all nominations must be recieved by December 24, 1999.

The Prizes

General Prizes:

First, Second, and third place winners will all recieve the upcoming N.AES 2.0. The first place winner will also receieve the latest PAPYRUS OFFICE.

First place: *Atleast* 250$ American In Cash and Prizes
Second place: *Atleast* 150$ American In Cash and Prizes
Third place: *Atleast* 100$ American In Cash and Prizes

Thanks to AtariComputing Magazine, Every applicant will recieve free magazine(s) and/or renegade CD's!!
We are working very hard trying to get a prize for all entries. Producing a game is a very long and difficult proccess, and we believe every attempt at it should be recognized!
Further sponsorship might possibly add more prizes to this list.

The Rules:ï¿½

* All interested programmers and/or groups which feel that they might be interested in entering this competition must e-mail one of the organizers (Bengy Collins, Jan Daldrup) and confirm their registration. Remember, registration is free, but we need it in order to set up prizes and determine if this competition should be cancelled or not. The Entry deadline is September 15th 1999! NO REGISTRATIONS WILL BE ACCEPTED AFTER THIS DATE.
* The new system calls in NVDI can be used only as enhancements to the game. The game must be fully functional on bare (Standard) MagiC configurations. However, the game is allowed to take advantage of system

extensions as long as the extensions are freely available. Example: BubbleGEM
* The game must either be shareware or freeware. However, if the shareware path is chosen, the game can not be crippled in any way.
* The game must come with documentation. ST-Guide and Text versions are acceptable.
* Game control will be one or more of the following: Keyboard, Mouse, Joystick, Joypad.
* GEMJing can be used for sound output.
* The game can not be officially released until Competition judging (December 5th, 1999). Games which are released before the end of the competition and games which already exist are disqualified.
* Any individual or crew may submit as many programs as desired.

The Deadlines!
Entry Deadline (All this requires is an e-mail!) September 15th, 1999
Competition Closes on December 5th, 1999. All Games must be received by this time!

Sponsors

This contest would not be possible if it were not for:

Woller GmbH for 3 copies of N.AES 2.0 (approx 200$)

ROM Logic for Papyrus Office (150$)

M.u.C.S for almost $200 in software

Atari Computing Magazine!! (Willing to give as many copies/cd's as there are entries! Wow!)

June Audio for sponsoring 6 Radium CDs (Radium CD's include tracks from dexter.d and m.pire (produced with Ataris), raytraced animations, a comic, paintings, starmaps and more. Each CD is worth about 22$)

If you want to enter, just send us an email (or use the form on the official contest pages) telling us your name and which game you might want to do (If you know ..)

Official English Pages:

3322. DRI library files

Newsgroup: comp.sys.atari.programmer

I have no docs. You can try to find the original Sozobon distribution (v1)
there is a compiler, assembler, linker and ar program, all with sources.
I have no URL.

It is old, but so is the DRI format.
If there is no URL, I can make a zip file for you.

Henk.

3324. Reading from the parallel (printer) port

Newsgroup: comp.sys.atari.programmer
Date: 1999-07-04 00:00:00 UTC
From: kopittke@ozlinx.com.au
Message-ID: <kopittke-0407992214350001@dialup-035b.tsat01.ozlinx.com.au>
Source record: 2741

Dear experts,

On a number of postings, I see people referring to the ST's printer port as being bidirectional.

I have seen a number of DIY electronic circuits designed to be connected to PC printer ports to allow interfacing of the computer with the outside world. These obviously transmit to and receive data from the PC printer port.

I want to know whether it is feasible to use these circuits with the Atari ST (which should be a machine superior to the PCs for which these circuits were originally designed).

I have not been able to see any C or Basic functions which seem to allow reading from the printer port. Am I overlooking something obvious or does one have to be a bit more devious? What function(s) should be called to allow reading from this port?

Greetings from Brisbane in Australia

Eric Kopittke

I don't know nothing about this electronic circuits, but I know something
about
programming.
Well, there is one (maybe 2) functions, which lets you read the parallel port.

This are:
int d;
Bconout(0, d); - output (0 - parallel port)
d = Bconin(0);

I used it with my Falcon030 and it works.

>to PC printer ports to allow interfacing of the computer with the outside
>world. These obviously transmit to and receive data from the PC printer
>port.
>
There are several implementations on the PC, newer are EPP (enhanced
parallel port) older are write only, so one has to read LptCtrl bits to
read something (4 bits only) and some are bidirectional, like for ATARI.

>I want to know whether it is feasible to use these circuits with the Atari
>ST (which should be a machine superior to the PCs for which these circuits
>were originally designed).
>
Unfortunately ATARI left out several pins from the 25pin connector, they
should be found somewhere if the circuit needs them. It's possible to
use the extra joystik ports of STE and Falcon, or use a cartridge to
parallel interface. For the latter check my homepage (Ethernet project).

>I have not been able to see any C or Basic functions which seem to allow
>reading from the printer port. Am I overlooking something obvious or does

I need to check for libs, but ATARI's printer port is connected to the
YAMAHA sound chip, it contains 16 registers that can be read or written to.

Hope this helps a little...

As I understand it, I may be wrong, the problem with using PC cards with
the printer port is the shortage of I/O lines. There are 8 data lines
that in theory are birectional but probably need buffering (probably ok
for most pico type A to D attachments). There is however only one
output line (pin 1 to strobe the printer) and 1 input line(Busy on pin 11
and activated by the printer. The BUSY line goes to the 68901 chip.
There is an unused I/O line available on pin 3 of the video connector.
This is controlled on bit 6 of port A of the sound chip. The sound chip is
a standard Yamaha AY-3-8910 and should be controllable using the
equivalents of BASIC's PEEK/POKE commands, or even a machine code
subroutine.

However if the card needs an address you could hard wire the address lines
to permanently select it, but you'd only be able to use one card at a time
It really depends on how many lines the card needs to render it operable.

(All the cards I've used have been simple to use, all you do is use an IN
statement to read the data & an OUT statement to set the port. It will be
a little more difficult with the ST as the the will need to be configured
either for input or output using the appropriate registers on the sound
chip. Quite simple but tedious)

Hope this is as incomprehensible to you as it is to me :-)

If I can help/confuse you further let me know

Regards

Mike Bedford

Hi

I am after the diagnostic cartridge that Atari did for the Atari ST
series. Ideally with manuals etc.

Thanks

3333. Rebuilding an Atari TT .. I need your help!

Newsgroup: comp.sys.atari.programmer
Date: 1999-07-07 00:00:00 UTC
From: Doctor Clu <clu-da-bard@geocities.com>
Message-ID: <3783A08B.4A8E@geocities.com>
Source record: 2749
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech,comp.sys.atari.advocacy,comp.sys.atari.programmer,stgt.atari

I recently bought a puzzle for $15. I'm not much one for puzzles, but this type I like....

It is a Atari TT, and this is what I've got so far....

"An Atari TT030 computer that is DEAD, NON-WORKING, INCOMPLETE, being sold FOR PARTS. Is missing keyboard, floppy drive, TOS ROMs, Hard Drive, Hard Drive Mount/shell, and a few other chips/components. Also does NOT inlcude any cords, mouse, or other cables. *Does include* the 68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. While there may be a chance that this computer could be fixed, I am selling it as a PARTS MACHINE ONLY."

Alright, the way I see it, the parts list is looking like this:

Missing list:

keyboard - I have a Mega ST keyboard. Would this be compatible?
floppy drive - No problem.. common.
TOS ROMs - Possible problem... anyone know of anyone who burns these?
Hard Drive - no problem.. common.. though the cables from the motherboard to the hard drive might be a problem.
Hard Drive Mount/shell - One could be fashioned to fit... might be challenging.
and a few other chips/components - again, possible problem, since more than likely these chips taken
were probably rare. Anyone deal
in ST/TT components?

cords - From computer to monitor/hard drive.. little problem
mouse - absolutely no problem.
other cables - "other" cables? Internal? Possible problem.

As for what's included... "68030 processor, power supply, VME cage, all connectors on back including the VME cover plate with two serial ports mounted on it. "

I'm relieved that the processor is there, and power supply... my only question is how good the motherboard and power supply is.

So these are the parts of the puzzle. I'm curious to sources for TT computer components, and where I can find specs so I can know what other parts I need to look for.

Thank folks for your helpon this savenger hunt!

3334. How detect MIDI-hardware?

Newsgroup: comp.sys.atari.programmer
Date: 1999-07-08 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <7m2iii$ff2$1@nnrp1.deja.com>
Source record: 2601

Greetings all,

As usually you can probably guess by the subject line what I am looking for here. I want a way to look if MIDI-hardware is present, but that at the same time DOES NOT lock up the computer if no MIDI-hardware is found. It wouldn&#65533;t be to much use else, eh?

Another question, that I recently posted here but got no response to, is if there is a known way to playback sounds (notes) that will work on both original Ataris as well as emulators like MagiC-Mac/PC and such?

And also, is it possible to whether or not a system has ST-compatible sound?

/Joakim

Greetings all,

I wonder if there is any reason why using copy raster (vdi-function 109)
wouldn�t work with MagiC-Mac? (The routines I use are taken
from ictari-10 if somebody still got these lying around somewhere)

I use this function to enable fast redraws in a program I have been
working on for a while now, and have been told that my blit-redraws
won�t work at all with MagiC-Mac.

This sounds very strange to me, as I myself have verified that
everything is alright with geneva, n.aes, MagiC and MagiC-PC. Is there
something special about MagiC-Mac that can cause problems like this?

I would really, really appreciate help on this one!

Ok, all for now!
Have a nice summer,

/Joakim

I know for a fact that vro_cpyfm() works on my Mac at work under the
MagiCMac demo, since I've run MGIF in quick VDI mode just fine.
This is in 256 colours, though.

>I use this function to enable fast redraws in a program I have been

Depending on what you mean by 'redraws', blitting may not be the way
to go on machines with graphics acceleration.

It can be very slow to copy data from the screen to RAM and back again,
while normal drawing operations can be fast as lightning.
(fVDI/mach64 does it's best to optimize such things, though, by actually
not doing the copy to normal RAM. Instead it uses free internal memory
on the card. I'm not aware of any other VDI that does this, however.)
If you're rather talking about creating a complex image of some kind in
RAM (such as for a game, perhaps), there isn't much choice, obviously,
but at least you won't need to blit from the screen.

>working on for a while now, and have been told that my blit-redraws
>won&#65533;t work at all with MagiC-Mac.

I assume you are aware of the usual problems with true colour graphics
modes using vro_cpyfm()? That is, the bit order may differ from card
to card and the only thing you can do with the normal VDI (NVDI and
fVDI have a special function) is to set test pixels, blit them into
normal RAM and see how they look (there's a nice library out there
somewhere that will do all this for you, but I can't recall the name).

Do not assume that you can access the screen directly in any way.
The screen address you can get from the Xbios may not necessarily
have anything to do with the one the VDI uses (with a graphics card,
the screen may not have an addressable frame buffer at all).

>This sounds very strange to me, as I myself have verified that
>everything is alright with geneva, n.aes, MagiC and MagiC-PC. Is there
>something special about MagiC-Mac that can cause problems like this?

The main difference between MagiCMac and the rest you mention is that
the others have an original Atari screen mode or emulate one.

Ok this is how it is done:

Before opening a window I reserve memory through MALLOC for the
blit-image. I have restricted colour-depth to a maximum of 16, since I
believe the first 16 are supposed to never change due to being system
colours. (Unless restricted in this way, huge amounts of memory will be
reserved on setups with great colour resolutions.) Right/wrong?

Objects will be redrawed for the first time with a standard OBJC_DRAW.
As soon as it is written, a copy of this is placed by the VDI-function
in the previously reserved memory. After this, all redraws will use the
VDI-function to restore areas when needed.

Is this a bad way to do things? I know for a fact that using OBJC_DRAW
all the way is fast enough on newer machines, but on older computers I
feel that the blitting really makes a difference that makes it worth it.
And furthermore, I have worked a lot with these routines, and I would
hate to have to drop them at this point. Especially as it seems to work
so well on everything but MagiC-Mac.

> I assume you are aware of the usual problems with true colour graphics

Which calls will be affected by this, and in what way?

Sorry if some questions seems to be to simple or silly, but since I don't have a clue to these things the only way to find out is to ask. :)

Regards,

Joakim

If it works ok on all the actual Atari models then is there really
a problem? Send ASH and bug report about magic-mac.

How do you do that? Restrict the colour depth, I mean?
I don't think I understand what you mean here.

>believe the first 16 are supposed to never change due to being system

The actual colours shown should normally be the same, but the pixels
will look very different in the frame buffer if you compare for example
the normal Atari 4 bit mode and a graphics card 16 bit mode.

>colours. (Unless restricted in this way, huge amounts of memory will be
>reserved on setups with great colour resolutions.) Right/wrong?

I don't see how you intend to get around reserving that huge amount
of memory.

>Objects will be redrawed for the first time with a standard OBJC_DRAW.
>As soon as it is written, a copy of this is placed by the VDI-function
>in the previously reserved memory. After this, all redraws will use the

OK. On a system with a graphics accelerator, your blitting is quite
likely to be slower, but it depends on what you're drawing and how much
you need to blit.

In a 16 bit mode you'll need to blit (and of course allocate memory for)
two bytes per pixel. An 8 bit mode would be one byte per pixel and a
24 bit mode three or four bytes (such modes are often really 32 bit)
per pixel.

>Is this a bad way to do things? I know for a fact that using OBJC_DRAW
>all the way is fast enough on newer machines, but on older computers I
>feel that the blitting really makes a difference that makes it worth it.

It should be relatively easy to do redraws instead of blits only in
graphics modes with 'large' pixels.

You could also do a small test to figure out if the machine is 'fast enough'.

>And furthermore, I have worked a lot with these routines, and I would
>hate to have to drop them at this point. Especially as it seems to work
>so well on everything but MagiC-Mac.

vro_cpyfm() really must work under MagiC-Mac, but perhaps some of your
code uses it in the wrong way. Your comments earlier about only using
a few colours points in that direction.

Have you tried your program in for example FalconTC, or on an Atari
with a colour graphics card of some kind?

>> I assume you are aware of the usual problems with true colour graphics
>> modes using vro_cpyfm()? That is, the bit order may differ from card
>
>Ok, but the first 16 should be the same, right?

The colours, yes, but not their actual representation.

>> The main difference between MagiCMac and the rest you mention is that
>> the others have an original Atari screen mode or emulate one.
>
>Which calls will be affected by this, and in what way?

The VDI should really insulate you from this, if you use it correctly.
That isn't entirely simple (an understatement) when dealing with colour
images in true colour modes, though.

If you never need to touch the things you blit from the screen, and
don't intend to display any colour images (as opposed to drawing things
with lines etc), you don't have to worry about any of this. The VDI will
take care of everything.
Naturally, you need to supply large enough buffers for the blits, though.

The only Atari machine that has a graphics mode that could cause the
same kind of problem (if I understand the original poster correctly)
is the Falcon, with its 16 bit true colour mode (well, if its only
a matter of the buffer size, the Falcon or TT 8 bit modes might also
cause problems).
Even testing there doesn't necessarily mean that the code is correctly
written to deal with any graphics card, though.

>a problem? Send ASH and bug report about magic-mac.

This isn't very likely to be a bug in MagiC-Mac. It probably only has
to do with the graphics mode used there and could be fixed with proper
coding.

Vro_cpyfm does work on MagiCmac. I use it for screen redraws in a
scoring package I wrote for the Atari and that package runs without a
hitch on my PowerMac at work under MagiCMac. Maybe someone was
thinking of the actual blitter chip when they said that blits
wouldn't work on the Mac?

I guess if fVDI had a function for allocating this memory on the GFX card
instead of using "system" memory this would be _very_ fast on a graphics card
as well. So maybe it's time for you to make this call availabl, Johan? Then
it's just a matter of checking the cookie for fVDI and then use a malloc
provided by fVDI instead and off we go. :-)

Such a function is coming in some form, but since very few applications
would ever use it, I do my best to automate these things instead.

In the Eclipse/mach64 driver, the AES background buffering (menus etc)
is already covered and that doesn't seem to cause problems for any
programs. I've also made it possible for screen->RAM blits of ordinary
applications to be done locally on the card, on the assumption that such
a blit will always be followed (soon) by one (might be extended in the
future) RAM->screen blit of the same area, and that the application
didn't really need access to the actual data.

I've not yet run into any application that actually uses the screen
data for any other purpose than to blit it back (except for the special
case of programs that write test pixels to the screen and then blit the
data back to figure out how to deal with a specific graphics mode (often
done by programs that can display images in true colour graphics modes),
but fVDI recognizes all variants I've run across of that and handles
them in another way), but two (plus the one we're talking about here,
it seems) 'reblits' the blitted area several times.

Naturally, none of this caching or memory allocation can be done if
there's not enough memory free on the card.

Hmmm, it's a long time since I did that kind of programming -- but I
thought that vro_xxx needs the same number planes for both source and
destination...

ask. :)

The first thing to check is how the MFDB for the screen is filled. It
is wrong to use XBIOS to find any values here -- just set the screen
address to 0 and let VDI worry about the rest..

I don't know if this helps, but using vro_cpyfm on MagiC-PC, everything
is OK up to 8 planes (256 colors) but draws black backgrounds at >=32k
colors! Checking the HTML docs (hmm, they're in German) it says to
use mode 5 (D_ONLY) with graphic cards, which is rather wrong, it worked
for me with mode 15 (ALL_BLACK) so I have again good white (!)
backgrounds in list windows.

```
Library used is the good old E_GEM 2.20, function "rs_sc_copy" which
calls "vro_cpyfm (_rc_handle, mode, pxy, screen, screen);"
```

What is the point of the INDIRECT ob_flag?

From the way it is documented, the ob_spec is treated as a pointer to the real ob_spec.

Why would one want to do this?

1:
Objects that have the same specification can point to a single variable.
2:
If you want more information (probably your own) in a object, you can let
the ob_spec point to a structure of which the first element contains the
original ob_spec and the remainder your private information.

Well, I haven't programmed the ST in a long while (Like, 6 years. I'm just getting back into it with emulation), but I remember it being useful for things such as changing icons on the fly (By changing where the bitmap object pointed to, and forcing the whole thing to redraw), or to save space when you have dialogs that look alike (You can have the part that looks the same points indirectly to the part that changes, and modify the pointer based on which one you want to show)

But that was a long time ago... I do remember it being extremely useful at times... Probably will be useless to you 99% of the time, but someday you'll be happy it's there :)

Patrick.

>use mode 5 (D_ONLY) with graphic cards, which is rather wrong, it worked

It might depend on the device driver which blit modes are available,
but generally I think they all would be. Their effect may not be quite
what you expect, though, since graphics cards usually aren't using
Atari style bit planes.

>for me with mode 15 (ALL_BLACK) so I have again good white (!)
>backgrounds in list windows.

I see what you mean now, but _please_ don't do that!

Mode 15 has never meant ALL_BLACK. It means all 1's, which in turn
happens to show the colour with highest index in paletted modes, ie
normally black.
In true colour modes, the maximum possible number is usually white
(max intensity red, green and blue)...

Why don't you use one of the obvious functions, that is v_bar or
vr_recfl? That way you can actually choose what colour to use and
expect it to work on any graphics hardware whatsoever.

I don't know about the various other VDIs, but in the current fVDI
mach64 drivers I've actually made blit mode 0 write all 1's and
mode 15 all 0's because quite a few programs erroneously seemed to
rely on these being white and black, respectively.
Now, if your program does the opposite (which _is_ more correct,
but still not a good idea), it won't work as you want, and if I
change the blit modes back to the way they should be, the other
programs will look wrong instead...

Once again, _please_ don't use vro_cpyfm for something it wasn't
intended to do (that is, filling with a specific colour)!

Yes, and what is strange with NVDI is that although it treats 8 and up
bit planes as graphics card oriented (I mean the 256 color mode is NOT
TT or Falcon compatible) it fills an area with white in 256 colors mode
and with black from 32k colors or more. The call in both cases is the
same, ie "vro_cpyfm (handle, ALL_WHITE, pxy, screen, screen);" !

>>for me with mode 15 (ALL_BLACK) so I have again good white (!)
>>backgrounds in list windows.
>
>I see what you mean now, but _please_ don't do that!

Well, I did nothing ;-), it's E_GEM library that uses this call !
(and to be honest I have little experience using any VDI).

>Mode 15 has never meant ALL_BLACK. It means all 1's, which in turn
>happens to show the colour with highest index in paletted modes, ie

>
Fortunately E_GEM contains the sources, so I can change that. But
please note that the above call is used for clearing a part of a

window (normally during redraw) and I thought it's faster than any
other method (no clipping, pxy preparation etc). Is it so ?

>I don't know about the various other VDIs, but in the current fVDI
>mach64 drivers I've actually made blit mode 0 write all 1's and
>mode 15 all 0's because quite a few programs erroneously seemed to
>rely on these being white and black, respectively.
>
Not much to say, you know better! The only problem (?) I can see is
that on /* bit blt rules */ of Pure C's VDI.H it defines ALL_WHITE
as 0 and ALL_BLACK as 15. This is confusing, but now it's fine with
me, thanks to your explanation above.

>Now, if your program does the opposite (which _is_ more correct,
>but still not a good idea), it won't work as you want, and if I

Ok, I have no problem to adapt, but I have no idea how many users
are using the E_GEM lib (I know it's been used in Papyrus !)
The change needed in rc_sc_copy is simple of course and anyone can
do it (in file TOOL.C).

>Once again, _please_ don't use vro_cpyfm for something it wasn't
>intended to do (that is, filling with a specific colour)!
>
Tell it to Christian Grunenberg ;-)
My tests were made under MagiC-PC/NVDI and the graphics card is a
QDI V2200 AGP 5096Q (?!). Having followed your discussions with
Ronald (and others) I'm really interested in testing fVDI. I'll
do it soon and let you know the results.

Greetings all,

I wonder if someone has some example or source code (GFA prefered) that
describes how to call for newer fileselectors? (freedom, boxkite and
others)

Do all/some of them use the same calls?

Thanks in advance,

Joakim

Yes. They all basicly replace the AES call "fsel_input", in GFA: Fileselect.
Most of them implement the newer "fsel_exinput" as well (The one to which
you can pass a title line.)

You do not have to do anything special.

Henk.

Henk Robbers <H.Robbers@cable.A2000.nl> writes:
> You do not have to do anything special.

... unless you want to support their special features, like selection of multiple files, non-modal activation, etc. There are several different procotols for that (Selectric, Freedom, Boxkite, MagiC-xfsl(), where Boxkite also supports xfsl() now), so a simple answer how to support these features is impossible.

However, as Boxkite also offers the MagiC xfsl()-interface (which is based on additional AES calls, detectable using appl_getinfo()), it might be a good idea to start with that.

Ciao

In what way is the 256 colour mode not TT/Falcon compatible?

It will of course be using packed pixels (one byte per pixel rather than
the bitplanes used by Atari 1/2/4/8 bit modes), but that shouldn't cause
problems for anything but colour image display (and not even then for
reasonably well written programs).

>>I see what you mean now, but _please_ don't do that!

If you're filling anything larger than a few pixels, the setup overhead
won't matter. It's even possible that the internal operation done will
be exactly the same in both cases.

>>I don't know about the various other VDIs, but in the current fVDI

It certainly would have helped if the VDI had been documented better...

>that on /* bit blt rules */ of Pure C's VDI.H it defines ALL_WHITE
>as 0 and ALL_BLACK as 15. This is confusing, but now it's fine with

It certainly is.
Before there were Atari machines with true colour graphics modes, it was (somewhat) true, though.

>Ok, I have no problem to adapt, but I have no idea how many users
>are using the E_GEM lib (I know it's been used in Papyrus !)

As long as everyone is using those modes in the same way, a VDI can take care of it. Hopefully, anyone who thinks long enough to realize the differences between paletted and true colour modes will not use those blit types at all. ;-)

>QDI V2200 AGP 5096Q (?!). Having followed your discussions with
>Ronald (and others) I'm really interested in testing fVDI. I'll
>do it soon and let you know the results.

Thanks.
I hope to get a final v0.94 released soon.

All interrupts occur in Supervisor mode (you do not have to write code to put the 68000 into supervisor mode in your own ISR routine).

The IRQ that services the midi ports does other things than just midi. On your own ISR routine you can check the stack to see if the IRQ was caused by a midi device, if not jump back to the original ISR vector.

3371. GEM redraw problems (yet a new one!)

Newsgroup: comp.sys.atari.programmer
Date: 1999-07-28 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <7nn15bsvo1@nnrp1.deja.com>
Source record: 2638

Greetings all,

I hope I can explain this problem so you can fully understand what happens. I have experienced problems with GEM-redraws, when I want to redraw object trees that have a filling pattern included. It seems to me like if the background pattern does not move like all the other visual content of the tree, but instead lies like a "watermark". I have been looking for days at my redraw code, but I really can't find any bugs that can cause this. Since all other content (text strings, buttons, boxes and everything else) is placed correctly I wonder if this is a feature (bug) in GEM, or a problem with my program? It makes redraws look really ugly. I guess the only solution I can see right now is to redraw the WHOLE window, and not just the parts that has been previously covered. Right/wrong?

Please help me!

(If you think you CAN help, but understood nothing mentioned above, please contact me, and I can mail you my program, so you can see what I mean)

I'm not sure this will get posted as I have been having difficulties accessing deja.com lately, but I'll give it a try...

Best regards,

Joakim

[snipped clear and well recognized description].

The only thing you can do about this is:
Snap the horizontal movement of your window on the smallest common multiple of repetition sizes of all the patterns you use. I'll hope you know what I mean :-)
But 16 will always do.

That's indeed true for all pattern fills in GEM.
For some things it can be a real pain, but for others it's very nice.

>feature (bug) in GEM, or a problem with my program? It makes redraws
>look really ugly. I guess the only solution I can see right now is to

This should only be a problem if your tree has actually moved on the
screen, but I guess that's what you're talking about.

>redraw the WHOLE window, and not just the parts that has been previously
>covered. Right/wrong?

Aligning to some minimum safe number of pixels as suggested by another
answer will of course work, but may not be what you want.
Another solution is to have a user defined pattern and change it to
reflect the movement.

Source record: 2642

Hello.

I'm having problem with load and save options in my current project
(control theaterlighting with atari computer).

I'm using Gfa Flying dialogues, and when I'm trying to call the
FS_INPUT (and EX_FSINPUT) I must reserve at least 4 kb.
If I don't my TOS (both interpreter and compiled program) respones
that I don't have enough memory for this library.

I've earlier been adviced to stay away from reserve in GFA-basic,
since it's not working very well.

I would like to find another way to get the FS_INPUT working,
has anyone got some idea?

/Jeppe Br&#65533;nnmark

From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <8813_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 2644

Hi Koos, I am working a bit on NOS and my system this summer, so here is question for you. Net2Net is GFA, so my system has to be resetted from time to time, or I've seen it's enough to close all programs and call an application in "single mode" to "reset" memory for N2N, I'm using MagiC with the MANAGER.

How can I make an event to start a program in "single mode" and/or one event to properly shutdown and restart the system once a day ? I've tryed different ways, but none is working at the moment, I'm doing something like:

```
#include <stdio.h>
#include <tos.h>
#include <stdlib.h>
#include <aes.h>

int main()
{
char *cmdline, tail[2]={0};
Pdomain(1);

/* creat("u:\\etc\\fastboot");*/

cmdline = getenv("SDMASTER");
puts(cmdline);
if (cmdline != NULL) shel_write(0, 1, 1, cmdline, tail);
OR->>
shel_write( 4, 0, 0, NULL, NULL);
shel_write( 4, 1, 0, NULL, NULL);

return 0;
}
```

ideas ?

Again on the MagiC subject:

- how do I call a program in "Single Mode" ? I tryed the shel_write call with SHW_SINGLE but I get bombs, I think it works only for the shell (app_id=0), any way to call it from my program ? Can I make the shell to do it for me ? How ?

- how do I make MagiC close all opened applications ? I think to a program like shutdown but without closing the shell, should I make a loop finding all ap_ids>0 and send an AES message to close them ? How ?

- What are the current version and state_of_the art of MagiCMac and MagiCPC ? I think to leave off my TT and use my Quadra800 insted, but I am wandering about possible problems, first of all what's better, use HSF on the hard disk seen by MagiCMac or use an Atari formatted SCSI drive ? I think performance is better with the Atari partitioned disk, but it may be better to see the filesystem from the "mac world" also, and use those nice backup and repair disk/file utilities for the Apple thing....

- What about networking in MagiCMac and MagiCPC ? is all going well on the serial and parallel ports ?

- Is there a way to communicate to the "parent" OS ? I mean, in MagiCMac can I write programs that access the Mac resources, or at least can communicate with programs running in the Apple system ? How ?

Best to ask the university department what they use. Most standardise on C
but there are some who use Modula. Both of these are supported on the ST.

3381. "simulating" a click

Newsgroup: comp.sys.atari.programmer

The Phantom Menace told me that Paul Mac posted a message about What
Language? to comp.sys.atari.programmer at 00:16:26, Tue, 3 Aug 1999:

>Hi ,
>
>I have limited programming experience , but hope to study it as part
>of my university degree.

With university, you're best off learning Pascal. I don't know it myself
(I am now officially unable to learn another language.. After trying
Java and C -- both failed) but apparently it's easy to learn and most
programming houses look for people who know Pascal

>
>Of course most of this work will be done on a PeeCee but what Language
>would be best if I also wanted to use my new-found knowlege to do some tinkering
>on my ST?

Since Pascal is hard/impossible to get hold of for the Atari, you're
best off learning either C or BASIC. I recommend you learn BASIC because
it's the easiest one.

Take a look at appl_tplay(), but note that for a full /click/, you have
to play a press /and/ a release event.

Ciao

Thomas

3385. from TOS to GEM

Newsgroup: comp.sys.atari.programmer
Date: 1999-08-07 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <8878_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 2652

Is there anybody who can suggest a good/experienced/skeleton/already
done/systematic way to "convert" a TOS program (printf, getch etc.) to a GEM
one ? I mean just avoiding the VT52.PRG in MagiC, opening a "text" GEM
window, send all text output in the window and catch keyboard input.

I think I should add:

appl_init
open the window

all printf etc., become print_in_window
getch etc. become evnt_keyb or evnt_multi (to handle the window itself)

close the window
appl_exit

No VDI, no graphics, should be simple, but what I want is an already made
source to "cut&paste" directly as I dot want to reinvent the thing.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

iirc you are correct - only (app_id=0) can issue SHW_SINGLE. My memory
is vague after this amount of time so I'm not sure one way or the
other. However, it may be worth trying the SHW_CHAIN or whatever it is
called (equivilent to the only singletos option).

It might just work out that as your app quits, the shell invokes the
chained program, and if that is registered with it as being "Single
Mode" then ... well, fingers crossed it still runs single iyswim!

>- how do I make MagiC close all opened applications ? I think to a program

appl_search() and appl_find() - again iirc, this will allow you to
iterate the running applications. Send them a WM_QUIT and hope they
take notice.

You could modify your click routines so that the app issues itself a
message saying what object got clicked. Then all you have to do is
issue those messages elsewhere and the app will be none the wiser.

Whilst I haven't used appl_tplay() under MagiC, I assume it works
because Thomas recommended it. Note though, that this call and its
counterpart appl_record() are buggy as hell under older Gem versions.

I'm sue I've seen PurePascal is still supported on ASH homepage, and
compatible with TurboPascal 7.0, this is really good for beginners, tought
people generally choose one of two ways: BASIC for simple approach accepting
limitations, C for hard coding and full control 8^)

> window, send all text output in the window and catch keyboard input.

Please allow me a question: why would you want to?

All the following is MHO, no flames please (though a good
discussion might help liven things up a bit around here).

Either your program is a text-mode application, or it is a GEM
application. You ought to decide which it should be.

There's nothing wrong with text-mode applications (.TOS and .TTP
programs) -- every operating system can handle them. TOS runs
them fullscreen, multi-tasking OSs such as MagiC open a window.
The user can configure that window's appearance, copy and paste
to and from it, etc. You can even use them from MiNT without
a GEM running, or in an X console window. You can easily port
them to any computer on Earth. All is well.

Now comes an application that is text-mode, but acts as if it's
GEM. It opens a window of its own (which looks different from
the console window that's opened for text-mode apps), but that's
as GEM as it gets. You still have to operate it by keyboard.
You need a GEM to run them on, and lose portability and
flexibility in the process. And you have nothing to gain for it.

That's my impression however. Either rewrite into real GEM
applications, or stick to text-mode. Don't create a "bastard".

Or alternatively, tell me (us) why you want to. :-) No offence
meant!

Yours,
Erik.

3393. Graphics routines 8 bp to 16 +

Anyone have any C code for translating a MFDB from 8 or less bit planes to 16 and up? I have code that kind of does this, but it doesn't display the colors properly and there must be someway to do this fairly quickly.

Any pointers etc.? I plan on releasing all the code to the project I'm working on when I distribute it, so if you don't want me to share your code, could you at least give me a few pointers as to what to try.

Thanks,

Dan Ackerman
aka baldrick@netset.com

Dead easy:

```
int dummy;

form_button(object_tree,object_nr,1,&dummy);
```

No, appl_tplay() works OK (it's used in Maus-Window to move the mouse
pointer and simulate a click when wind_get(WF_OWNER) isn't available)
under all versions of (Atari-)GEM. It's just appl_trecord() that has
some problems, so that you can't easily use a combination of record and
play to repeat a sequence of actions.

Ciao

Source record: 2665

```
Hello !

I'm "converting" an assembly source into GFA and I would
like to know how putting a routine in Timer B using GFA ?

Here is a part of the original source :

move.l #timer_b,$120

timer_b:
jsr player+4
bclr #0,$FFFFFA0F

I've tried this in GFA, into a loop :
SLPOKE $120,player%+4
~BCLR($FFFFFFFA0F,0)

but it doesn't work...

Who can help me please ???

(for more info, it's the Sid Sound designer player source)

Thanks !!

What you're trying to do is clear bit 0 at address $FFFFFA0F but what
you are actually doing is clearing bit 0 of the value $FFFFFA0F.
Replacing the ~BCLR() with

SPOKE $FFFFFA0F,BCLR(PEEK($FFFFFA0F),0)

will get the value at $FFFFFA0F, clear bit 0 and write it back again.

Hello.
I'm currently woking on a project to control theatrelighting with the
Atari.

Sofar everything has worked out well exept multitasking.
So I've decided to make the program into smaller pieces.
My problem now is that I all the smaller programs need to
share one common memory address.
In this address there is supposed to be 120 bytes, that any
program can change at any time.

This is how I decided to build the program:

* Program init
* APPL_INIT
* Reserve 120 bytes (is there a really good way of doing this?)
* Open a file called EXPOSURE.QQQ in the root.
* Save a longword containing the address I got for the 120 bytes
(how do you save a memoryaddress and how to do as a longword?)
* Close the file
* GEMDOS 49 (PTERMRES) quit and stay resident.

My problem is in the reservation of 120 bytes and saving of that
longword containing the address.

Would appriciate a fast answer!
Thanks

Ah, a Gem prog. That makes it a bit easier.

>* Reserve 120 bytes (is there a really good way of doing this?)

Any kind of dynamic memory allocation will do, so malloc/free in C or simply the OS one: Malloc/Free.

Alternatively, use a 'static' block declared within your program. From APPL_INIT am I correct in thinking you are using GFA and not C?

I don't know any GFA but what you want for 'static' is a GFA method whereby you can reserve a block of 120 bytes whose address will never change once the program has loaded.

>* Open a file called EXPOSURE.QQQ in the root.
>* Save a longword containing the address I got for the 120 bytes
> (how do you save a memoryaddress and how to do as a longword?)

Dunno for GFA but for C doing it via the 'static' way would go something like this...

```
static char common_block[120];

fp = fopen("EXPOSURE.QQQ","wb");
fwrite(common_block,sizeof(char*),1,fp);
fclose(fp);
```

The above saves the start address into the file. This'll only remain valid whilst the current program remains running of course.

>* Close the file
>* GEMDOS 49 (PTERMRES) quit and stay resident.

And this keeps it running, fine.

>My problem is in the reservation of 120 bytes and saving of that
>longword containing the address.

If all the programs are Gem ones (ie they use APPL_INIT) then you may consider using messages. The program that reserves the memory can send a message to all the others telling them the address of the block it has reserved.

Alternatively, with a slight adjustment you could have the "memory reserver" be a desktop accessory. This of course will automatically remain resident (you will have to use the 'static' method - malloc is problematic for DA's) and it can just sit there waiting for messages to be sent to *it*. Replacement Gem's make it even easier. Just launch multiple processes, one of which is the memory reserver.

Naturally one message it can expect is...

WM_WTF_IS_THAT_MEMORY :-))

... to which it will respond...

WM_ITS_ADDRESS_IS_IN_THIS_MESSAGE_HERE

Send messages via appl_write. Await them in the usual manner - event_multi for instance.

Dunno, I've never done it. I've one thought (possibly useless)...

What about an in-place transform? Convert to the standard "portable"
VDI format where the planes are split one after the other, add some
more planes, then convert back to device dependant format.

The above is putting the address of the timer_b routine into memory
location $120.

>timer_b:
> jsr player+4
> bclr #0,$FFFFFA0F
>
>I've tried this in GFA, into a loop :

As I don't use GFA I haven't the foggiest idea what that GFA statement
is attempting to do. Doesn't make sense whatever meaning I try and
give it.

>~BCLR($FFFFFFFA0F,0)
>
>but it doesn't work...
>
>Who can help me please ???

Such details are slipping from my mind over time - but are you sure
TimerB can be called from a language? What cpu register and stack
usage does it have? Put it this way, if it turns out to be impossible
to write TimerB routines in C then it will definately be impossible
with GFA, thus assembler may have to be used for the TimerB routine
itself.

On my web page you will find some source code for locating the start address of a gfa procedure or function.

That might help?

```
in gfa it would be something like:

adr%=malloc(120)
if adr%<=0
'some error!
endif
open "O",#1,"buffer.dat"
out% #1,adr%

Thank you, grazie, I'm starting to write now, and I do not want VT52 to
manage the text window, but simply change actual output to do writes on
program's own window. I want to use a library just to handle those nonmodal
dialogs and things that changes from normal TO to MagiC or other systems with
enhanced AES functions and so.

I do not know what those libraries do, so I will consider your opinion and
then get a recent release to have a look, thanks for suggestions.

> break;
> }

This code does not work under MagiC6, atleast not on my TT... Btw., the wind_get-call should be "wind_get(win, WF_OWNER, &owner, &open, &below, &above)", but this doesn't help much either ;-)

Basically the problem is that while wind_get(0, WF_TOP...) returns the correct handle, the following wind_get-call only returns the same values every time (owner 1, open 0, below 11, above 1...). It also never returns FALSE, so the loop never ends.

I have a lot of small, but annoying problems like this with MagiC, especially the SM_M_MESSAGES to the screenmanager is giving me headaches. They *definitively* don't work as documented!

Hi!

In comp.sys.atari.programmer joska@nuts.edu wrote:
> This code does not work under MagiC6, atleast not on my TT...

Does Thing's topping of already running applications work? I.e., run a non-AV-Client (e.g. Pure C) open some windows in it, switch back to Thing and run the program again. Answer "No" to the question whether you want to run the app again, and it should get topped, including its menu bar.

If that works, the code is OK.

> Btw., the wind_get-call should be "wind_get(win, WF_OWNER, &owner,

Well, I wrote it from memory, so errors are to be expected ;)

It does in Thing, with MagiC 6.x on the Falcon, as with MagiC Milan (and N.AES, of course). Just a guess: You aren't using Pure C here? It doesn't work correctly for new wind_get/wind_set() opcodes, as it has an internal table telling how many parameters each opcode returns/expects. With new opcodes, the original PCGEMLIB code either crashes or does nonsense. You'll need your own wind_get() implementation, even for WF_TOP of you want to use its extended output.

If you're not using Pure C, I can't tell you what the problem could be.

> I have a lot of small, but annoying problems like this with MagiC,

At least the message to activate an app's menu bar does work correctly, Maus-Window successfully uses it.

Ciao

Thomas

Well that isn't hard have that bit done. Problem is coming in
with the mapping of the colors properly in high resolutions. I can
translate the images up, but then the colors are completely wrong.

Hi!

GH>but are you sure TimerB can be called from a language?
The important questions therefore (and for interrupts in general) are:
- How can I asure that no register is modified by the interrupt routine?
- How can I generate the rte instruction to finish the interrupt?

This is rather difficult to impossible (and compiler dependant) in C and I
don't think it's possible in basic.

Another point you have to pay attention to is that you do not use any non
reentrant code (function) which is used by your main program

IMO interrupts should only be programmed in assembler because it's the only
language where you have full control over the generated code which is
absolutely neccessary for interrupts

My problem is that while it will hide an application without problems, it
might (or might not!) show a completely different application even when
I'm using the same apid... Or it will hide the wrong application and
display the correct one. Or get both wrong. Occasionally it will actually
get both right. And yes - I *am* checking the parameters :-/

Sounds like me :-) I'm using appl_control() in Taskbar under N.AES, it
would make things a lot easier if I could use it under MagiC as well.

> * Save a longword containing the address I got for the 120 bytes
> (how do you save a memoryaddress and how to do as a longword?)
> * Close the file
> * GEMDOS 49 (PTERMRES) quit and stay resident.

You can write a simple TSR-Program for the AUTO-Folder, which allocates the memory, writes the address of the memory in a cookie and terminates staying resident. All your little Programs can use the Cookie to get the adress of the memory. If the cookie doesn't exist,you can start the TSR-Program or quit your program with an error message. For this little TSR you must not use any AES call, since the AES are not initialized. In C your programm can look like

```
int main( void )
{
void *memory=Mxalloc(<amount>, <global>);

create_cookie('myID', memory);
stay_resident();
}
```

but this work is done much better in an assembler program with less overhead.

Greetings

Martin Elsässer

The only reasonable answer to your question is: Do it yourself!
(Or rather, find a library that does it for you.)

I've only done this the other way around (for fVDI), but what I do
there is at least compatible with the Falcon desktop.
Unfortunately, it seems like Atari couldn't decide on how vr_trnfm
was supposed to work in true colour modes. The Falcon desktop always
does a vr_trnfm, but it has specialized pre- and post-processing code
for the 16 bit case.

In short, 16 bit vr_trnfm is only supposed to combine the bits into
words (it's apparently up to the caller to make sure that those bits
somehow correspond to the correct colours), but 24/32 bit vr_trnfm
must also do a translation via the (software) 256 entry VDI palette to
give a valid colour value (I seem to recall that I had to reverse the
bit order too).
Then of course, the normal desktop can't display icons in any other
true colour mode than 16 bit in any case...
(It simply assumes that anything that isn't 16 bit can be treated as
a palette based mode, which isn't very smart when it comes to masking
the background in 24/32 bit. (To get any icons to display at all in
32 bit mode, fVDI can be told to do all blits in D=S mode.))

If you want to see how fVDI does the reverse of what you're looking
for, just let me know. As I said earlier, you shouldn't go the
vr_trnfm way at all, though, for true colour modes.

I've been coding in x86 asm and c/c++. I just found this cool atari st in my closet but it has no software and only a floppy drive. I started playing around with tos for a bit. But anyways, I want to know if there is any freeware/shareware atari st assemblers or a c/c++ compiler for atari st. Or if there is one available for purchasing, where I could get it. I really want to do some graphics programming and see how fast I can get this beast to run in 3d. Which reminds me, I guess I would somehow need to find information on the graphic card (video modes, software interrupts, etc.) so i could do graphics programming. Anyways peace out, and any help is defintely appreciated.

I'm not certain I get your meaning here. What I have does work at
least partially in all the tests I've done. I guess my sticking point is
above. "It's apparently up to the caller to make sure that those bits
somehow correspond to the correct colours". This is the part I'm stuck
```

on. I'm used to the Falcon vr_trnfm bug. I can't remember exactly what it is at the moment, but basically clearing an mfdb on a falcon in 16 bit color doesn't work correctly (or at least something along those lines). I used to use a Falcon all the time, so had the routines fixed for that years ago.

The resulting bitmaps look correct except for the colours. So I guess what I am looking for is how to properly get these colors to appear on the screen. I thought I had someway to do it about 5-6 years ago, but I can't find the code anywhere and it's just been too long since I played around with those routines.

I imagine it's something fairly simple in effect. A matter of order in the definition of the colors. Of course I could be completely wrong on this.

Right now my process is in the following manner.

```
save_current_screen_colors();

uncompress_ximg_pallette();

load_ximg_pallette();

uncompress_ximg();

vro_cpyfm_ximg to screen();

free_temporary_decompression_for_ximg();

...

restore_screen_colors();
```

I would have thought that this would have been the correct method since the vdi pens in 16bit color and up only apply to the drawing of pixels and don't actually change any colors already on the screen. However this doesn't seem to do the trick.

Do I have to manually go through the resulting image and redraw all the pixels into the correct colors?

Dan Ackerman
aka baldrick@netset.com

AREA [N.PROG]
In uno strano messaggio del 08 Aug 99 Rory Street (90:102/153) scrisse al
povero Mike De.Petris:
RS> When you say single mode. Are you refering to when you set MagiC to
RS> single tasking mode and run a program?

Yes, Thing desktop can execute programs in single mode, for example keeping
SHIFT pressed.

RS> Ahh with some programs it is best to let them close themselves down. For
RS> example the program Manager by Koos Kuil actually uses a menu call to
RS> shut down Semper. Forcing a program to shutdown usually means you have
RS> to clear up after it all the resources it was using.

Yes but I want to auto-reboot my BBS each night to avoid freezing in the
morning after some sessions/users.

RS> Not sure about that one ... anyone?

I think it will be safer to use an HFS disk that I can see from MacOS, even
if slower, and also easier to backup and repair.

MDP>> - What about networking in MagiCMac and MagiCPC ? is all going well
MDP>> on the serial and parallel ports ?
RS> I know it is possible to network a PC and an ST with the Parralel ports.
RS> I am not sure if the Mac has the same functions..

Nono, I was asking about using serial connections in MagiCMac and MagiCPC for
STiNG, IConnect and so on, not to connect to a "real" Atari 8^) this is what
I am doing now.

RS> One thing that would be nice. Is if someone could create a networking
RS> client for MagiC just like the Novell client..

My NOS can connect ppp or slip, that you access all tcp/ip world, actually I
have a serial ppp connection to a win95 PC that acts as a router for the TT
on my LAN.

RS> Oooh thats a hard one. Anyone?

Yes I found myself some docs about MagiCMac and communications to the MacOS,
you can do Mac calls from MagiCMac Atari programs and communicate with the
MacOS, very interesting, tought a bit hard to build and test I think.

```
AREA [N.PROG]
In uno strano messaggio del 08 Aug 99 Steve Sweet (90:102/105) scrisse al
povero Mike De.Petris:
MDP>> - how do I call a program in "Single Mode" ?
SS> It souds like you need the recently translated Magic Programmings
SS> Doc's.

Yes I have it but it is not clear about this point. Seems that only
application 0 (the shell/Thing) can do the single mode call, freezing all
other applications and releasing memory, this is the SINGLE.TXT, but does not
say what to do if I am not application 0:

Description of "single mode" of Mag!X
=====================================

Position: Mag!X 1.12
Andreas Kromke, 4.3.93
English translation: Peter West, April 99

Mag!X distinguishes between three differently paired types of applications:

a) The application #0
b) Accessories
c) Other applications (ap_id > 0)

The following call serves for launching programs under Mag!X:

*
* int shel_write(int doex, int isgr, int isover, char *cmd, char *tail)
*

Warning: MultiTOS works in a way that is completely incompatible to
previous TOS versions. The new calls are controled via <doex>
(0 here is program launch with automatic isgr-identifier and
1 with manual isgr-identifier, etc.) while "isover", which is
called "iscr" here, controls the ARGV passing.

Thre are 5 different possibilities to launch applications from within
others ("magx.h"). Here are the parameter values for <isover>:

* #define SHW_IMMED 0 /* PC-GEM 2.x */
* #define SHW_CHAIN 1 /* TOS */
* #define SHW_DOS 2 /* PC-GEM 2.x */
* #define SHW_PARALLEL 100 /* MAGIX */
* #define SHW_SINGLE 101 /* MAGIX */

Of these, modes 0 and 2 are not supported by Mag!X. <doex> must always
be 1, otherwise only previous shel_write() calls will be revoked (as in
```

TOS 1.04).

1. SHW_PARALLEL
A new application will be created. It inherits all standard paths and files from the current application. The new application runs in parallel to the previous one. One will only get an error code if a memory shortage occured during set-up. There is no message at the termination of the new application (no "death-of-child").
2. SHW_CHAIN
This is the procedure under TOS. The program makes the call, and after terminating itself the AES launches the new program. SHW_CHAIN does not work with desk accessories, as these must never be permitted to terminate.
The new program inherits the standard paths and files that the previous program had at the time of its launch. In general these are in turn the ones that the program had that earlier launched the "ancestor" of the application with SHW_PARALLEL. In the case of application #0 therefore the new program gets the standard paths of the AES.
If DESKTOP.APP (shell of GEM 2.2) is installed as a shell, then Mag!X will insert the current path and drive before the filename.
3. SHW_SINGLE
Works like SHW_CHAIN, with the exception that before calling the program all applications apart from application #0 and #1 (SCRENMGR) are frozen. The programs are unfrozen once more after the program terminates as long as it did not make a new shel_write() call with SHW_SINGLE on its part.
One should add that from Mag!X 2.00 onward when calling shel_write in SHW_SINGLE mode the current paths of the caller are passed to the parent and hence to the new program. Warning: The paths of the calling program are destroyed after this, though this is not critical as the call following shel_write is generally a Pterm.

The loops for SHW_CHAIN and SHW_SINGLE look like this:

For application with ap_id > 0:

```
while(doex)
start(isgr, cmd, tail);
```

For application #0:

```
while(world_is_turning)
{
start_desktop();
while(doex)
{
if (single_mode && single_mode_not_yet_activated)
activate_single_mode;
else unfreeze_programs_if_appropriate;
start(isgr, cmd, tail);
}
```

```
unfreeze_programs_if_appropriate;
}
```

How do I launch a program in "single mode"?:

a) Ensure that I am application #0 (i.e. ap_id == 0).
b) Set paths and drive for the new program.
c) shel_write(TRUE, isgr, SHW_SINGLE, cmd, path);
d) All important settings to temporary file or shell-buffer.
e) appl_exit()/v_clsvwk()/Pterm0.

How do I launch a program in "chain mode"?:

a) If appropriate set paths and drive for the new program and make a
call
shel_write(TRUE, dummy, SHW_SINGLE, dummy2, dummy3);
in order to set the paths for the new program (incompatible to TOS).
b) shel_write(TRUE, isgr, SHW_CHAIN, cmd, path);
d) All important settings to temporary file or shell-buffer.
d) appl_exit()/v_clsvwk()/Pterm0.

After the program terminates the shell will be reloaded automatically.
When calling the shell one gets in the command line (->shel_read) the
"magic" sequence (magx.h):

```
/* tail for default shell */

typedef struct
{
int dummy; /* a null-word */
long magic; /* 'SHEL', if it's a shell */
int isfirst; /* first call of the shell */
long lasterr; /* last error */
int wasgr; /* program was a graphic-app. */
} SHELTAIL;
```

If <isfirst> is set then the status is to be read from something like
DESKTOP.INF, if <isfirst> is not set then one takes the temporary file or
shell-buffer.
<lasterr> is the return value of the program running previously. If this
was a GEM program then the error will already have been displayed in an
alert box. It is well known that the longword is negative if the error
occurred with Pexec itself; a program return value always has the high
word 0.

Then I haven't a clue, perhaps one of the replacement VDI's has a
function to help, unless there is some way to temporarily open another
workstation fooling it into using the "other res" and pinch its
mappings iyswim.

Ah yes, your two question above make that clear. Would require an asm front-end to reconstruct a C environment. Not impossible but hardly any point for a timer!

>Another point you have to pay attention to is that you do not use any non
>reentrant code (function) which is used by your main program

Offhand, I seem to recall the deferred vertical blanking list can have a "standard C call" shoved in. As you state, there is little point - asm is best. ;-)

NVDI 5 has vr_transfer_bits() to handle all sorts of transformations,
even with dithering, color palette optimizations, and so on.

Ciao

Thomas

What vr_trnfm bug?

>it is at the moment, but basically clearing an mfdb on a falcon in 16 bit
>color doesn't work correctly (or at least something along those lines). I

If you're talking about the fill with zeroes/ones blits, that is not a
bug in FalconTC but in some documentation and header files.

> The resulting bitmaps look correct except for the colours. So I

It would.

The normal work of a standard to device specific vr_trnfm is to reorder
the separate bit planes into the Atari interleaved layout. Graphics
cards, and FalconTC for that matter, don't use bit planes, however, so
something else needs to be done.

In a byte per pixel mode there's still a palette, so the only thing
that's needed is to combine eight words at a time into 16 separate 8 bit
pixel values. There's nothing for you to worry about there.

In 16 bit mode there's still a need to combine bits into 'chunky'
pixels, in this case a word per pixel. Unfortunately, it's not possible
```

to use this combined value on the display since it's only a palette
index and you need the actual colour value (RGB components). It would
have been nice if the VDI had done this for you (preferably using the
palette for the workstation in question), but for some reason Atari
decided that the Falcon vr_trnfm should only do the bit combining.
The conversion to a real colour value is done afterwards by the AES
using a look-up-table (with the 256 16 bit values of the normal palette).
IIRC, vr_trnfm delivered the bits in the opposite order to what the AES
wants so there was some bit reversal going on before the table look-up.
Also, for proper masking of icons in true colour, the 'transparent'
background needs to be black (colour value 0) rather than white (palette
index 0), so the AES (again, IIRC) does some pre-processing to modify
the white and black pixels.

Finally, there has never been an Atari TOS machine with 24/32 bit colour,
so the AES doesn't know that it may need to treat this similarly to
16 bit. It simply does a straight vr_trnfm and expects the resulting
values to be directly usable. This means that the VDI has to do the
palette look-up itself in this case.

This is all a mess and I intend to add support in fVDI for the new
NVDI 5 things someone mentioned so that we don't have to worry about
it in the future.

>guess what I am looking for is how to properly get these colors to appear
...
> I imagine it's something fairly simple in effect. A matter of

Not quite.

> I would have thought that this would have been the correct method
>since the vdi pens in 16bit color and up only apply to the drawing of
>pixels and don't actually change any colors already on the screen.

The problem is that those pens aren't used by vr_trnfm either in 16 bit.

> Do I have to manually go through the resulting image and redraw
>all the pixels into the correct colors?

You could do that. Positive Image does this in its 'VDI mode', but it's
very slow.

A much better way is to draw test pixels with suitable red, green and
blue values (one at a a time), blit them back to a table and then do
some ORing for each pixel while writing to an MFDB that can then be
blitted to the screen. Done properly, that will deal with any bit
layout without problems.
There is a library that does this for you. Wasn't it written by Guido
something?

>>If you want to see how fVDI does the reverse of what you're looking
...
> I might just do that if I can't figure out where to go from here.

Well, I've added the relevant parts below in any case.
Perhaps they can make a few things clearer. Note especially the
differences between the 16 bit and 32 bit versions.

The following code snippets are run after the initial word reordering
that is the same for all bit depths. For the bit plane modes, no more
work is needed.
This code is used right now and seems to be completely compatible with
the normal AES and desktop. If anyone discovers any problems with it,
please let me know.

I'm well aware that the code is quite slow, but I needed something that
was easy to hack around in while I was trying to figure out how this
was supposed to work. It'll all be rewritten later on.

MiNT must save and restore the FPU registers on every context switch. If
your hardware isn't really stable that can cause problems. But it'S a
hardware problem.

You can compile a MiNT kernel for yourself and completly disable the FPU
register saving :-).

3434. The HRD format

Newsgroup: comp.sys.atari.programmer
Date: 1999-08-18 00:00:00 UTC
From: Class 4 / Centek <vxp@imaginet.fr>
Message-ID: <7pepj0qlg1@news.imaginet.fr>
Source record: 2502

Hi there !

Does one of you know how works the .HRD file format ?

It seems that before the name of an object there's its number,
but I don't understand how to know the offset betwen objects...

I'd be realy interested also on the international (multilangue) file
format of Ressource Master, so I could include that in my own
RSC editor.

BFN,

Thomas (the autor of the RSC editor for Dolmen : Fashion)

This format is documented in my WERCS editor manual.

It says the object names vary in size and are terminated by a null
byte. The object name ends the record for that object.

So each object record could be different size.

That help?

3436. Re: Disk formatting in Gfa-basic

Some psuedocode for formatting one side. Just bung the lot in a loop
for the number of sides (2 strangely enough)...

```
side = 0;
MAGIC = $87654321;
BLANK = $E5E5;

//buffer
BYTE p[];
p = Malloc(9 * 1024);

//format each track
for track = 0 to 79
status = Flopfmt(p,1,9,track,side,1,MAGIC,BLANK);

if status <> 0
failed;
fi
rof

//blank the whole buffer...
for i = 0 to 79

3437. MiNT coprocessor violation error

Newsgroup: comp.sys.atari.programmer
Date: 1999-08-18 00:00:00 UTC
From: mgrove@iwvisp.com
Message-ID: <rrk095rk3uk80@corp.supernews.com>
Source record: 2699

Is it possible to loosen up or disable what ever MiNT does to check the return data from the FPU? I know that my FPU isn't as stable as on a stock machine, sometimes causing Gembench or FPB Bench to lockup, but this only occurs under MiNT. TOS (4.04) seems to let the dirty data go and not complain. Photoline and Phoenix crash quite a bit under MiNT with the error, but work fine under TOS. The image processing results are the same AFAIK.

TIA,

Mike

3438. message problems

Newsgroup: comp.sys.atari.programmer

Source record: 2505

Hello everybody!

I started GEM-Programming a few months ago and I have a problem
with the slider-handling.
Following situation:
My Program opened a window and jumped into a event-loop (using
evnt_multi or evnt_mesag).
When I click an arrow the Program recieves the messages such as
WA_DNPAGE, WA_UPPAGE etc
twice. So that my Program scrolls up/down/left/right two pages.
With Magic everything works fine.
I did test it on a MegaSTE with TOS 2.06 and a Falcon with TOS 4.04. On
both Computers all
Messages depending the Sliders are sent twice. Now I want to ask: Is it
a bug in TOS or
is there a way to handle the sliders in a "correct" way?
I simply did something like this:

```
[...]
switch msg_buff[4]
{
case WA_UPPAGE:
---scroll up---
break;
case WA_DNPAGE:
---scroll down---
break;
[...]
```

By the way: I use Lattice C 5.60.

Thanks for tips and tricks
Heiko

Hi!

In article <37BBE851.364802C8@machine.ruhr.de>,
root <ossi@machine.ruhr.de> writes:
> Now I want to ask: Is it a bug in TOS or is there a way to handle the
> sliders in a "correct" way?

It is a bug in the AES (fixed by WINX), but there's an easy way to work
around it: Simply wait for double clicks in your event loop, whether you
actually need them or not.

Ciao

Thomas

P.S. You should check your settings, writing as "root
<ossi@machine.ruhr.de>" isn't a really bright idea, IMO ;)

Hello,

I have some Atari StE's, and am interested in accquiring a hard drive.
Either proper Atari ones or a nice cheap solution using something else (?).
By cheap, I mean I don't want to spend more than 100UKP at most.

Thanks!

Hi Heiko,

you did it right. It's a bug in TOS (AES).

You should get the timerticks of your systemclock between two events and
"eat" the second message if it comes too fast.

oldticks = 0;
switch msg_buff[4]
{
case WA_UPPAGE:
if ( nowticks() > (oldticks + 50) ) // is the last message older than 50
timerticks (0.25 seconds) ?
oldticks = nowticks();
---scroll up---
break;
case WA_DNPAGE:
---scroll down---
break;
}

There is no Bios function to use for nowticks(), but I would read the
system variable at address $0004BA (_hz_200). The value of this address
increments 200 times per second.

long nowticks()
{
long *lptr;

lptr = 0x4BA;

return( *lptr );
};

My C-knowlegde is a bit old, but it may work.

good luck

Stefan

You might look for a used Syquest drive (44, 88 or 135 meg drives and
something like a ICD Link 1 or 2 as a host adaptor.) Works great on
an ST.

Mario Becroft at http://www.ak.planet.gen.nz/~mario/ sells an adaptor which will allow an IDE drive to be fitted to an ST. The driver is $NZ150, which is around 50 pounds, plus postage. On top of that, you have the cost of a drive. Using Mario's adaptor a 2.5" laptop drive can be fitted inside the STe's case, or you can use a free standing unit outside the case. The adaptor fits in the cpu socket and comes with an upgrade to tos 2.6

I hat the same Idea, too. The time the mouse-button is held down might
be so
long that the computer sends 2 messages. But I thought that this should
happen
by other events too. But WM_CLOSED, FULLED etc are sent correctly. So I
thought this
could not be the reason.
But Thomas Binders suggestion to wait for a doubleclick works fine. I
used evnt_multi only
only with the MU_MESAG flag. (I think its funny that MU_MESAG alone is
buggy, but if you wait for mouseclicks AND message-events everything
works fine :-))

I think I will wait for mouseclicks until I have more experience in
programming
Ataris.

Thanks to all who helped me!!!
Heiko

3449. Can anyone help?

Hey all!

Please read quick and see if you can help!

There is an Atari ST running an automated mailer machine, and
the company want to replace it with a PC. I am now trying to get
an emulator to work well under Win95, that allows for communication
via the serial port to the mailer machine.

I have tried WinSTon, TOSBox etc etc but when I use the original
ST disks to boot up in the PC, the second disk causes 3 BOMB
icons to appear on the screen and it hangs.....

So now I dont know what to do! Any suggestions????

Thanks
RN

Get both at ftp://ftp.lip6.fr/pub/atari/Programming/
(get 1st its index(es):
ftp://ftp.lip6.fr/pub/atari/Programming/Index

> if there is one available for purchasing, where I could get it.
AFAIK there are no more to purchase...

> want to do some graphics programming and see how fast I can get this
> beast to run in 3d. Which reminds me, I guess I would somehow need
Calm down guy, the "beast" has only a 8MHz 68000... so don't expect
too much from it...

> to find information on the graphic card (video modes, software
> interrupts, etc.) so i could do graphics programming. Anyways peace
Video modes :
- basic ones available: 320x200x16c(colors, not bits) or 640x200x4c or
640x400x2c (monochrom B&W, this one needs a special monitor whereas the
two others works on a TV or standard monitor)
- AFAIR you can extend it by various software dirty incompatible time-
consuming tricks up to 448x272x16 (max I think, very tricky, needs half
processor power to sustain it... and lots more to fill it with
pixels...)
Software interrupts:
On Atari system, you do not need them for graphic programming (apart
from color rasters :)...).

> out, and any help is defintely appreciated.
Hope this helps.

3451. v_opnvwk under Geneva

Newsgroup: comp.sys.atari.programmer
Date: 1999-08-25 00:00:00 UTC
From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <7q1mj6$6o1$1@snipp.uninett.no>
Source record: 2518

Can somebody explain why the following doesn't work under Geneva?

```
int work_in[11]={1,1,1,1,1,1,1,1,1,1,2};
int work_out[57], vw_handle;

work_in[0] = Getrez() + 2;
v_opnvwk(work_in, &vw_handle, work_out);
```

Under N.AES and MagiC this works fine, but under Geneva wv_handle is
always 0, which indicates that the call failed.

I know, and I did. The problem appeared to be Thing, *all* applications
failed this way when I ran Thing under Geneva.... Sorry for the
inconvenience folks.

Taskbar now works fine under Geneva, have a look at
http://atari.nvg.org/Taskbar/ for proof :-)

Hi!

Jo Even Skarstein <joska@nvg.ntnu.no> wrote:
> work_in[0] = Getrez() + 2;

You don't want to do that ... Always supply 1 here, which means "use the current driver/resolution". Getrez() in a GEM application is a Bad Thing (TM). I know this is stated in some docs, but it's for v_opnwk() (i.e. a PHYSICAL workstation), when you want to have a workstation with other than the current resolution. Forget it when using v_opnvwk().

Ciao

Thomas

(Almost) all you need is here:
http://wombat.ludvika.se/dhs/files.html#misc
The fastest DSP-assembler (lacks some preprocessing features though):
ftp://ftp.lip6.fr/pub/atari/Falcon/Programming/qdspv010.lzh
And probably some more things at:
ftp://ftp.lip6.fr/pub/atari/Falcon/Programming/
```

> Try This (Pure ASM), OK with MagiC, MagicPC,...

> [LineA-Code snipped]

I hope you'll /never/ use this in an application, especially if it's supposed to work on machines with a graphics card. LineA is _obsoleted_, furthermore Atari has _never_ allowed _writing_ to the negative offset variables.

appl_tplay() works OK on all machines, it's just appl_trecord() that has problems, but this isn't necessary for positioning the mouse cursor or simulating any other AES event.

Ciao

Thomas

After you load your RSC file with rsrc_load() the starting adress of
the block of ram used to load the RCS file is placed into one
of the AES global arrays. You can look there as the header to the
resource file contains the total trees.

I wrote this from memory but I think it will work. If you need
some actual code to do this maybe I can find it.

It's the 12th 16-bit word in the RSC file header.

(Sorry its not in GFA, but this C code should suffice)

#include <osbind.h>

// return number of OBJECT trees in resource file
// INPUT filename (pointer to string of 8-bit signed chars)
// OUTPUT answer (number of trees) or zero if an error occurs
uint16 num_trees( schar8 *filename )
{
sint16 handle; // file handle (signed 16-bit integer)
sint16 header[18]; // file header (array of 16-bit ints)

// use GEMDOS to open file
handle = Fopen( filename, READ );
if( handle < 0 ) // error - return zero
return 0;

// read header into memory
Fread( handle, sizeof( header ), header );

// don't forget to close the file!
Fclose( handle );

// return word 12 of array (offset 24)
// note: C arrays are indexed from zero, so array[11] is 12th
// array member
return header[11];
}

Like Thomas says, it'll be the "Getrez()+2" section then. I've had it
fail (unexpected at the time) myself, which implies MagiC 2 rejects it
also. Can't be sure - simply that at some time it *must* have failed
under something else I'd never had known!

From MWC gemdefs.h ...

```
typedef struct rshdr
{
int rsh_vrsn; /* Resource structure version # */
unsigned int rsh_object; /* Offset to first object */
unsigned int rsh_tedinfo; /* Offset to first tedinfo */
unsigned int rsh_iconblk; /* Offset to first iconblk */
unsigned int rsh_bitblk; /* Offset to first bitblk */
unsigned int rsh_frstr; /* Offset to free string index */
unsigned int rsh_string; /* Offset to string data */
unsigned int rsh_imdata; /* Offset to image data */
unsigned int rsh_frimg; /* Offset to free image index */
unsigned int rsh_trindex; /* Offset to tree index */
unsigned int rsh_nobs; /* Number of objects */
unsigned int rsh_ntree; /* Number object trees */
unsigned int rsh_nted; /* Number of tedinfo structs */
unsigned int rsh_nib; /* Number of iconblk structs */
unsigned int rsh_nbb; /* Number of bitblk structs */
unsigned int rsh_nstring; /* Number of free strings */
unsigned int rsh_nimages; /* Number of free images */
unsigned int rsh_rssize; /* total bytes in resource */
} RSHDR;
```

I don't have the extended rsc-file format to hand. :-|

>I anyone knows how to do this from GFA I would be even
>happier! :)

Both 'int' and 'unsigned int' above are 16 bit values, so you could
Fopen(),Fseek(),Fread() on the rsc-file.

Yes, iirc the whole system is valid except for (of course) the Gem
parts, AES,VDI,GDOS. LineA is up also - for the console and (again
iirc) a mouse can be brought into life via the LineA without too much
work (probably needs sprite and handler).

>And also: can GEMDOS be used in the boot sector? for file i/o?

If by that you mean Rwabs(), GetBpb() etc then yes.

Oh, one side-issue that may be relevent if you're planning a TSR: file
accesses that add to the "40 folder bug" will persist for the life of
the system (so scanning the whole hard disk structure with
FsFirst/Fsnext is bad news). If the auto folder prog quits then it
isn't an issue (provided the bug never "triggers") because it all gets
handed back on process termination.

Actually, the VDI is available as well, but you have to open the physical
workstation yourself. I don't know about GDOS. I wouldn't recommend using
LineA, most graphics-cards doesn't support it.

Well, it sounds you're victim to the Psetlimit()-bug in Geneva without
MiNT. Read http://www.deja.com/=dnc/getdoc.xp?AN=483949820 for details
and how to patch Thing to make this problem go away - but with losing
the ability to limit memory on installed applcations.

Ciao

Thomas

Hi Joakim,

If you just want your ST to play a sine wave, I'd tend towards using the onboard sound chip rather than the DMA sound. To play a sinewave through DMA sound, you'd first need a sample of a sine wave, whereas (I think!) the Yamaha PSG chip will play one for you. Have a look around the net for documentation on the sound chip.

3477. Re: DMA-sound question

Newsgroup: comp.sys.atari.programmer

Source record: 2544

Hello,

> If you just want your ST to play a sine wave, I'd tend towards using the onboard sound chip rather than the DMA sound.

The method I use ATM is the SOUND command (which I believe uses the sound chip) in GFA-basic, but people have reported that this causes problems with MagiC-Mac and have requested support for DMA-sound instead.

The program I am writing is a hear trainer (hEARCoach), and the sound thus represents notes. Originally I only intended to have support for MIDI-devices but it turned out that many users without MIDI-equipment was interested in such a program. Therefore I decided to add some basic sound support.

My idea was then that a sine simple would not be impossible to create directly in memory.

Best regards,

Joakim

If the resource file is already loaded, it may be simpler to use
something like this:

treecount()
{
int count;
OBJECT *tree;

for(i=0;TRUE;i++)
{
rsrc_gaddr(R_TREE,i,&tree);
if(tree==NULL)
break;
}
return(i++);
}

If you create it, it won't be a sample. ;-)

Anyway, most programming languages that support floating point numbers
have trigonometric functions. Surely GFA Basic must have SIN()?

Then it's just a matter of calculating a proper step value for the
frequency you want and build a table for values from 0->PI (most trig
functions expect their parameter in radians). Then invert those numbers
to get the PI->2PI interval and copy as many times as you want
(depending on how much RAM you are prepared to use (you'll have to reset
the DMA address more often for a shorter waveform)).
Naturally, you can build more of the table using SIN() directly, but
those functions aren't very fast and there isn't any point, anyway.

The values you get from SIN() will be in the [-1,1] range, so you'll
have to scale them to the 8 bit integers used by the DMA sound.

Well I really meant GEMDOS. Can I do F* GEMDOS-calls?

Thanks to you and Jo for your answers.

My AUTO-program aims at doing some (Falcon) resolution changes.
There is a problem though: IIRC the resolution change is effectively
done only when the amount of memory taken by the new screen is lower
that the one of the current system-screen (otherwise it hangs). That's
why I thought it was a memory-allocation problem.

I have let VSetScreen handle this, but it seems it's not the right
way to do it... Should I use VSetMode, VGetSize and Malloc instead? But
this way I think I'll lose the memory allocated for the first screen by
the system, which is really annoying as my program deals with launching
memory-hungry programs (demos/games)... Or does anyone know how to use
Srealloc (which I think allows reallocating the screen memory)?
BTW I am also looking for the calling procedure of the other unofficial
XBIOS function that allows VIDEL registers loading & saving...

3482. undocumented "short resident routines"???

Newsgroup: comp.sys.atari.programmer
Date: 1999-08-31 00:00:00 UTC
From: Guillaume D&#65533;flache <Guillaume.Deflache@depinfo.enseeiht.fr>
Message-ID: <7qgqhr$n88$1@nnrp1.deja.com>
Source record: 2549

Anyone has remembering of an undocumented feature of TOS which allows (sort of) "short resident routines" put before GEM starts in the memory between the end of system variables and the start of the OS to be kept there and executed in some way (if they had some sort of code checksum value or marker)?
I know it is very vague but I have already read this in some doc I cannot remember either its name or location. Any clues?

> cannot remember either its name or location. Any clues?

It's undocumented, but the bios will look at each 512 byte block in
memory. If a block starts with the long $12123456, followed by a pointer
to the current 512 byte block and the checksum of all the bytes in the
block is $5678 - the bios will execute the code in the block.

Of course, as the Falcon's Video RAM needs aren't fixed. Best way is to
Srealloc() the amount of bytes returned by VGetSize, and then use
VSetScreen with the address returned by Srealloc() for the physical and
logical screen address (provided it was non-null, otherwise an error
occured).

Ciao

>allows (sort of) "short resident routines" put before GEM starts in the
>memory between the end of system variables and the start of the OS to
>be kept there and executed in some way (if they had some sort of code
>checksum value or marker)?

If I understand what you meant, you're describing the way TOS searches
for reset resident programs between _phystop and the end of the system
variables ($0600). If this is the case, then here's some pseudo code of
how TOS finds this type of reset resident program.

```
address = contents of _phystop
while (address > 0x600)
{
address = address - 0x0400
if( contents of address == 0x12123456)
if( contents of address+4 == address)
if( (sum of words at address to address+510) == 0x5678)
execute code at address+8
}
```

IIRC this type of program is executed after bootsectors are checked and,
if required, executed.

As a small example, here's a small program that sets up a reset resident
program. I've added some comments (which is rare for me ;) to try and
show how it works.

```
; start of code

_phystop equ $42e

start
clr.l -(sp) ; into supervisor mode
move #$20,-(sp)
trap #1
addq.l #6,sp
move.l _phystop,a5 ; get end of physical RAM
move.l d0,-(sp)
move #$20,-(sp)
trap #1
addq.l #6,sp

set_up
sub.l #$8400,a5 ; _phystop-33k bytes (puts it below the
```

```
screen memory)
move.l a5,a1 ; use A1 as temp address pointer
move.l #$12123456,(a1)+ ; here's the flag
move.l a5,(a1)+ ; and the address of the block
lea reset_prg(pc),a0
move #(end-reset_prg)/2,d0

.loop1
move (a0)+,(a1)+
dbra d0,.loop1

calc_checksum
move.l a5,a0
clr d0 ; clear D0 for checksum calculation
move #$fe,d1 ; 255 words ($00 to $fe)

.loop2
add (a0)+,d0
dbra d1,.loop2

move #$5678,d1 ; the value required
sub d0,d1 ; subtract checksum from required value.
move d1,(a0) ; and store at the end of the block

exit
clr.l -(sp)
trap #1

; this is the resident code. It must be less than 502 bytes to fit in
; one block. If the code won't fit, a 'bra.s' can be used to jump over
; the checksum word.
reset_prg
pea prg(pc) ; use PC relative code so it can be
move.w #$9,-(sp) ; so it can start at any address
trap #1
addq.l #6,sp
rts
even
prg
dc.b 'If you see this line, my reset '
dc.b 'resident program was executed'
dc.b 13,10
dc.b 0
even

end equ *

; end of code

I doubt LineA is "unsupported" as it appears (GDOS for instance,
plonks itself into the LineA font ring). No matter, I agree using
LineA when there is any other alternative is just making trouble for
yourself.

I thought about it for a while, then a a longer while, and now a whole
week has gone by! Tbh I can't think of any reason to replace the ST in
the first place. It'll be running long after the PC that replaces it
has expired, and even if it doesn't there are still plenty of ST's
about to replace a busted one.

Finally, if ever the software wanted upgrading, unless you've got the
sources for the ST app then it'll have to be written from scratch or
replaced with a PC app anyway.

> [Source code snipped]

Substracting a fixed value from _phystop and assuming it's no longer
screen memory is likely to fail on machines like the Falcon. A better
way is to use Malloc() to allocate 1024 bytes, align the addres returned
to a 512-byte-boundary, and then use Ptermres() on exit (if you're not
planning to trigger a reset right away).

Ciao

Okay, here's what you do: Go out and buy a midi-tower PC
case. Remove the Atari 1040 ST motherboard and put it in the
PC case. Now, tell your boss it's a PC--and run the same old
software on it that has been working all along.

That would be a much better way of doing things. You can almost tell the
code was developed with an ST in mind. I found a description of this in
an old ST World (January 1989 for the curious) and I made sure the
example code worked on the ST before posting it. Not having a Falcon,
any extra memory used by the screen wasn't taken into account.

It seems to be in the versions of TOS I've seen (TOS 1.00 and 1.62)
and it's in Magic 5.11 so I'd guess it's in all TOS versions.

3499. Problem to install SCSI HD on MEGA STE !!!!

Newsgroup: comp.sys.atari.programmer
Date: 1999-09-02 00:00:00 UTC
From: David ROCHE <DROCHE@SOFTHOME.NET>
Message-ID: <7qj698jqn1@jaydee.iway.fr>
Source record: 2566

Hello,

I have a MEGA STE and the hard disk inside don't works fine but it is
recognised !!

Thus i trying to install an other SCSI disk MAXTOR LXT213SY (200Mo) and the
MEGA STE don't recognize it with the HDX.PRG and HDINSTALL.PRG utilities.

How can i do ?
Is there a special disk for MEGA STE ? (i don't think because the interface
is SCSI)

HELP HELP HELP !!!

best regards, David

Well, even with my "solution" there's no guarantee the memory address
returned my Malloc() isn't located too close to the current screen
memory - but it's not very likely.

Ciao

3506. FS: Programs inexpensive

Newsgroup: comp.sys.atari.programmer
Date: 1999-09-10 00:00:00 UTC
From: Vladislav Belov <vlad@melitopol.net>
Message-ID: <936997614.481942@zebra.mlt.dnepr.net>
Source record: 2573
Cross-posted to: comp.programming.threads,comp.sys.acorn.programmer,comp.sys.amiga.programmer,comp.sys.apple2.programmer,comp.sys.atari.programmer,comp.sys.be.programmer,comp.sys.mac.programmer,comp.sys.mac.programmer.codewarrior,comp.sys.mac.programmer.games,com

Hello to all interested in getting inexpensive, but current
software.
Have over 1000 different programs of all kinds. Below is a small list of
programs, just to see how inexpensive they are. Have graphic sofware, 3D
Building sofware, Architecture software, Programming software, etc.
For the list, and any question YOU MAY HAVE , please e-mail.

- Adobe Illustrator 8.0 = 20$
- Adobe Pagemaker 6.5 = 18$
- Adobe Photodelux = 18$
- Adobe photoshop 5 = 20$
- Adobe Premiere 5.0 = 18$
- Corel Draw 9 = 20$
- Corel Photos: Professional 5000 photos = 15$
- Corel Xara 2.0 = 20$
- Macromedia Authorware = 18$
- AutoCAD 14 = 20$
- ArchiCAD 6.0, ACAD 14.5 = 22$
- architectCAD = 18$
- Arhicad 6.0 = 20$
- AutoCAD 15 (AutoCad 2000) = 25$
- MathCAD 9 Professional = 25$;
- Borlad Delphi 3.02 = 18$;
- Borland C++ 5.02 = 20$
- Borland C++ Bilder = 25$
- Borland Delphi 4.0 (4.2) + libraries = 20$
- C++ Builder 3.0 Borland = 20$
- Cd-recorders = 20$
- Linux 5.0 = 18$
- LINUX OFFICE '98 = 20$
- Linux Red Hat 5.1 = 20$
- Mathlab 5.2 = 20$
- Microsoft Office 2000 = 25$

and others !!!!!!!!!!

These CD's are not copies, with all pictures, tools and everything.
E-mail me if interested. And if you buy several CD's, the price
will
be less.
When you reply me, please, tell me the kind of programs in which you
are interested.
I also have a lot of games.

Thank you.
Vlad

:working.
:Regards
:Bob.
:
A pretty easy way to install MiNT is to use TAF's 7 DD
floppy disk set, available at fine ftp sites everywhere.
However,
(there's always a 'however' isn't there?)
this installs Xwindows, and an old MiNTnet,you will have
to start replacing old files with newer ones. Mind you,
you have to do that also with the KGMD(KEMD with kellis's
translation) as it is an old distribution.
Martin-Eric Racine (see his TT pages) is working on a
new installation program(NMD), and there is also the CD
MiNT distribution (MiNT'99) from Whiteline, with an
installation program. good price I think.
this should get you going! :-)

Are you going to produce the 'Atarian' using MiNT? <grin>

From: ben@imperial.co.uk
Message-ID: <7rkpso$vm6$1@nnrp1.deja.com>
Source record: 2579

Hi All,

I have recently installed GCC v2.7.2 onto my Hades KGMD setup. This works just fine and I can write and compile C++ programs without any problems.

I would really like to write GEM applications in C++ so I have been trying to install the GEM++ class libraries to help me do this, but I have been having a few problems.

One of the compilation errors I have been receiving is a cannot find file error from the linker. It's looking for gemlib++.a (or was it libgem++.a) which I do not have. I know that GEM++ needs either GEMLIB or MINTLIB to run which I thought I had installed.

So, my question is, could anybody out there who programs using the GNU C++ compiler and the GEM++ libraries please tell me how to setup GCC, and GEM++ and let me know if there are any other programs required in the setup so that I can at least compile the example programs that come with GEM++.

Any help would be greatly appreciated.

Thanks.

Regards,

Ben Hills.

> Can anyone help me?

Depends on what kind of "dynamic variables" you mean. For variable sized
arrays of arbitrary type elements, there's the function qsort(), the
prototype should be in stdlib.h. qsort() implements - as the name
suggests - the quicksort algorithm, which is (one of) the fastest
general sorting method(s) currently known.

Ciao

Thomas

P.S.: I'm not absolutely sure whether the Pure C libraries contain this
function, as it's POSIX, not ANSI.

Dont fear, it is in stdlib. The (original) Turbo C book claims it is ANSI.
It certainly is in the ISO standard C library, which thinks it is a copy of ANSI.
But who cares? A good reason for including a function in a library is because
it's USEFULL. ;-)

Beware: The sorted elements must be all the same size. If they are not, built a
array of pointers and sort them.

To use qsort() I have to build an array with pointers?
But I don't habe such array, and I don't want to have it.
It's like this:

```
typedef struct bla{
char *....
....
struct bla *next;
struct bla *prev;
}
```

For example I have a base with about 10000 such structures and I want to sort
this 10000 structures.
Can I make it with qsort???

> Can I make it with qsort???

No, not directly. Either build a temporary array, then use qsort(), and
then adapt all next and prev pointers. Or implement quicksort yourself,
though the approach is quite fixed to be used on arrays.

How does your linked list get filled? Wouldn't it be better to switch to
AVL trees? These are balanced binary trees (i.e. they have a root node,
and each node has two leaf nodes, the left being less than its parent,
the right greater or equal, and each branch is almost of the same
height), and sorting/balancing is done at insertion time.

Ciao

Thomas

If all these 10000 bla's are in an array, you can. If not you must make one.
qsort sorts arrays. Building a pointer array make's qsort extremely fast, because
it needs only move the pointers around. It's a very good idee, whether you want it
or not. :-)

Hi everybody,

My stupid question of the week: Is it possible to have a command line longer than 126 characters?

I wrote a tiny TTP that do nothing but catching the command line. Up to 126 characters, no problem.

Beyond 126 characters, we're supposed to use the ARGV protocol but it seems not to work the right way under MiNT/N.AES/Jinnee. Under plain TOS (3.06), a too long command line leads to bombs.

What I know about ARGV is that the command line length is set to 127 (that's what my TTP can read) and the content is (supposed to be) inserted before the environment string. But it never happens. My TTP reads the long word at basepage+44 which is a pointer to the environment string. Right? All right, I got a pretty long environment string (because of MiNT) but the command line has

disappeared in the mean time! At the normal command line address (basepage+128), there is only the length byte (127 according to ARGV protocol) and nothing beyond (0, 0, 0, ...). The environment string is correct but there is no command line anymore, neither before, nor after the environment string. And I never find an "ARGV" string anywhere like I was supposed to.

So... What's wrong? Is it Jinnee's fault that poorly handles the command line? Is it definitively impossible to have a long command line? Or is it me that don't understand the ARGV protocol? Or is it once again one of these bl**dy MagiC-only things?

Last thing to say: I'm talking about GFA.

OK. Thanks.
I'll try to make it with qsort (I'll make an array with pointers).
Thanks very much.
During this week I'll see how it's working :))

Thanks

Hi!

Remi Villatel <maxilys@normandnet.fr> wrote:
> So... What's wrong? Is it Jinnee's fault that poorly handles the command line?
Well, AFAIR the TOSRUN mechanism found in N.AES 1.x doesn't correctly
handle ARGV, i.e. the TOSRUN manager already doesn't receive the ARGV
environment string, so that any TTP hasn't got a chance to evaluate it.

I'm not sure whether this is the correct reason, but at least one stage
before the actual TTP is run drops ARGV= - so it's not your fault. For a
test, just rename your .ttp to .app and let it print the environment. It
should then contain ARGV=.

Ciao

Thomas

Remi Villatel a ï¿½crit :
Hello Remi

You can find explanation in French on my page:
http://www.utbm.fr/les.personnes/olivier.landemarre/argument.htm

Long ARGV don't supposed the system you use, it depend only of the the startup of your
compiler. For GCC no problem, I think for PureC, Lattice too. For other I don't know and
perhaps it need to change the startup.

Donc en francais peut etre un peu plus correct que mon anglais, les arguments longs tels qu'ils
ont ete definis officiellement (et qui est une rustine au probleme!), specifie que au dela de 125
il faut passer l'argument en environnement avec ARGV=..... C'est le header du programme
qui se charge de faire la popote! pour le transmettre au main(). Heureusement que l'environnement
n'etait pas limite! Cela marche tres bien et je te conseil d'aller lire ce que j'ai ecrit la dessus (cf adresse
plus haut). Comme tu semble utiliser GFA je ne sais pas si ca marche il faut que le code de demarrage
le supporte. Si ce n'est pas le cas ca serait bien un monde qu'il n'y ai pas quelque part un patch.
Aussi le code de demarrage bien fait retourne le ARGV dans la commande standard (qui n'est en fait
pas limite a la reception et l'elimine de l'environnement)

3529. Magical MU* coder sought! (C/Linux)

Newsgroup: comp.sys.atari.programmer
Date: 1999-09-17 00:00:00 UTC
From: quaeris@*removethis*bb2.betterbox.net
Message-ID: <quaeris-1709991847080001@adsl-209-76-109-186.dsl.snfc21.pacbell.net>
Source record: 2596

Greetings,

I began playing a MU* about two years ago, after playing pen/paper games for years. With the right group of people, a real magic can arise between the players. Everywhere I have looked for something similar, I have found tired echoes of that magic. It's time there was a really mythic, literate, serious, joyful, fantasy roleplaying game. Something intricate enough to keep people fascinated, and give them a place to really -explore- the possibilities of text-based online role playing.

We want to create a place like that; a place that is magical, and intricate, and fascinating. A place that doesn't grow old, but grows. A place where people can interact with the mythical fantasy world in a way that's rewarding and fun.

We are seeking creative, inspired programmers to help us in the creation of a text-based MUD environment. We have been at work on this project for about a year and a half, and have a stable development environmnet running on an Intel linux box. Coding can be done on a home PC, but having knowledge and access to Linux is preferred, and our server can be used by all team members.

(A mud is a text-based, self-running adventure system, based on a database and rules of interaction - telnetable, where people create characters and interact with each other and the virtual environment. A good working knowledge of C is required, a sense of teamwork, and the ability to work a minimum of about 2 hrs/week on the project.)

Our Platform:

We have an always up server, a majordomo, running on Red Hat Linux (intel). We use a DCS code tracking system and have a good organizational structure within the project, meaning there is web based record-keeping and things are kept closely updated within it, creating a resource for our coders. Mordor is a fairly primitive codebase, familiarity with C is a must.

Our Goals:
We want to create an inspired and inspiring team that will allow us to grow a fantasy-based role-playing environment that is rich, rewarding, and fun to be a part of.

If you're looking to join a team with some interesting goals, and help us create a great text-based mud, please send me some info on yourself, what you're looking for, etc and we'll quickly set up some time to chat.

Remove asterisks to reply...

Thanks!
q*uaeris@bb2.be*tterbox.net

Really it dont matter.

What I would like to do is use the Falcon to run Linux and Linux apps
(ie ftp services, mail, www, net scape, etc)

And maybe Wine (Windows emulation under Linux, said to be faster then
Windows itself)

I use AIX 3.2 on an IBM Risc machine at work, so I am fairly familure
with Unix, and to keep my Falcon Alive I just thing that Linux would be
cool to have on there.

Thanks

Wine Is Not an Emulator. (hence WINE) Unless something has changed very recently it will only work on x86 machines, which rules out the Falcon.

Well, I have not installed Linux on a Falcon, but I am in the process
of installing it on my Hades, so the process should be the same.

Although there is now an unofficial port of Red Hat to the M68K
platform there are currently no installation utilities for the
Atari so your best bet would be to install the Debian distribution.

You will find information on installing Debian on the Atari platform
on their WEB site. http://www.debian.org

You will also find a list of suppliers on their WEB site so you
shouldn't have any problems getting hold of a copy. You could also
look at the Whiteline Linux CD's which are basically Debian.

http://www.atari-world.com

Hope this helps.

Regards,

Ben Hills.

Probably, yes. I'd really like to see that. But I'll keep my Atari's stock now.

>Supercomputer? my ***!! there's nothing super at all about the Apple, there
>never has been and there never will be. All you get is a nice bubble full of
>marketing hype. Once you switch on the flashy box it's the same old hat...

No it isn't.It's a well-designed case with a high-quality computer inside
running an OS that allows me to get my work done without crashing constantly.
Unlike a certain widespread OS from a certain Redmond software company.

>BTW: what the US government allows or not is ridiculous... If for example
>Saddam wants a truckload full of G4 processors, he'll have them tomorrow.
>As an exemple: I live in Belgium, and as a Belgian citizen have nothing to
>do with the laws of the US Government. If I buy a G4 tomorrow, and decide
>to sell it next week to one of the "certain countries" I'm not doing
>anything illegal. Just "free trade" :-)

I wasn't saying that the US export restrictions aren't ridiculous. I know that
people that want these machines will get them, one way or the other. There are
discussions going about raising the specs. All I said was that these
restrictions apply to the PowerMac G4, because by US government standards,
they're supercomputers. A stock Atari, Amiga, or any Wintel machine isn't.
According to these standards.

As for free trade, trade is not always as free as think. If you buy a G4 in
Belgium, wether or not you are allowed to export it to Saddam Hussein depends on
Belgian export law. There might just be some restrictions on that. Of course,
you could just do it anyway without registering the export, but that would still
be illegal.

>Apple, IBM and Motorola are Multi nationals designing and producing chips,
>processors and parts all over the world. How do you control a Multi
>national firm? What makes you so sure that the G4 is a 100% developed in
>the US processor? Ever heard of India? I wouldn't be suprised if that
>country in on the "certain list" also :-))

I don't think that IBM and Motorola have their processors produced in countries like India. Maybe a lot of more "mundane" chips are produced there, but not the cream of the crop. And I'll bet that their top designers are in the US also.

Apple has outsourced production of the iMac to companies in Taiwan and Korea, but the PowerMacs are being produced by Apple at Apple's factories in the US, Singapore and Ireland.

>Times have changed, we live in a global community, ever thought about the

>more then a way to control economies and protect the home market.
>To use the words of the Great Guru himself: "Let's think different"

My bank account is most certainly not administered in the US, it's on a huge mainframe in Amsterdam. That mainframe runs software that I have written. Contrary to what you may think, if you have a bank account, it is probably administered on a big mainframe that is fully owned by the actual bank itself. Not on a big server in the phillipines. Banks are very (*VERY*) privacy-sensitive operations. They develop most of their software in-house and run it on their own mainframes.

Hi,

I'm writing a routine to load a PI1 file in VB (eaugh!) on a PC(aaahh!), so I can put screenshots of my old games on my website. I can load the palette information correct, then next is the screen information.

What I can remember is each byte is two nibbles(4 bits) - the high one gives the colour (palette index) of one (even numbered) pixel, the low nibble gives the colour of the next (odd numbered) pixel. Yet when I run my code, it looks like I've tried to load the picture in the wrong resolution! (black vertical stripes & distorted graphics)

Now is this anything to do with the fact the atari & PC stores bytes the in different ways (big & little endian) - I dont know if they do, but I should imagine it would cause a problem anyway!

Or is it anything to do with something not being aligned on a word boundary (erk - faint memories of atari programming!)

Please let me know if you can help!

Cheers,
Simon.

Here is a snippet of code (in VB - should make sense!) I'm using to display the image:

```
nCCount = 1
For nYLoop = 0 To 199
For nXLoop = 0 To 319 Step 2
nCPointer = Asc(Mid(strImage, nCCount, 1)) And 15
imgScreen.PSet (nXLoop + 1, nYLoop), RGB(nPalette(nCPointer, 0),
nPalette(nCPointer, 1), nPalette(nCPointer, 2))
nCPointer = (Asc(Mid(strImage, nCCount, 1)) And 240) / 16
imgScreen.PSet (nXLoop, nYLoop), RGB(nPalette(nCPointer, 0),
nPalette(nCPointer, 1), nPalette(nCPointer, 2))
nCCount = nCCount + 1
Next
Next
```

A PI1 has the format

1*word (usually 00 to indicate low rez)
16*word for the palette
32000 byes for the picture data

The low rez screen is in words for each plane.
1st word = plane 1
2nd word = plane 2
3rd word = plane 3
4th word = plane 4

the 5th word is the next word across the screen (screen base + 8).
This sequence carries on until the screen is filled.

This is one of the pi1 formats.

Degas Elite format saves files of 32066 bytes in size, because they
contain palette animation.
So
1*word (00 low rez, 01 mid rez, 02 high rez)
16*word palette
16*word palette animation
32000 bytes picture data.

A small hint... try run some picture conversion program on your st,
like picfib or Gemview. You can make a batch, generating all the .gif
you need.

3539. Help with Colour Icon Format (*.CIC)

Newsgroup: comp.sys.atari.programmer
Date: 1999-09-24 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <7sfn76$sl6$1@nnrp1.deja.com>
Source record: 2456
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Greetings all,

I wonder if any of you have got information on the colour icon file (*
.CIC) created by Ataris resource editor? How does it handle bitplanes,
mask and stuff?

Thanks in advance! :)

Regards,

Joakim

That may (or may not) depend on the source and target formats. The
conversion, should it need applying, is simple provided you are
dealing with whole word and longwords. (ie if you want a real headache
try and deal with 12 bit FAT's as used by floppies).

16 bit word: exchange hi and lo bytes (eg $1234 -> $3412). Job done.

32 bit longword: exchange ho and lo words, then do word conversion on
each word (eg $12345678 -> $78563412).

To clarify:
$1234 5678
$5678 1234 <- word exchange
$7856 3412 <- byte exchange on each word.

>Or is it anything to do with something not being aligned on a word boundary
>(erk - faint memories of atari programming!)

From "picfmt.doc" on (iirc) umich...
<<PICFMT.DOC>>...

<DEGAS> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

```
1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite> *.PI1 (low resolution)
*.PI2 (medium resolution)
*.PI3 (high resolution)

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color
numbers)
4 words right color animation limit table (ending color
numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2
= right)
4 words 128 - animation channel delay in 1/60's of a second.
[0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a
second.)
-----------
32066 bytes total

<DEGAS Elite (Compressed)> *.PC1 (low resolution)
*.PC2 (medium resolution)
*.PC3 (high resolution)

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control/data bytes
4 words left color animation limit table (starting color
numbers)
4 words right color animation limit table (ending color
numbers)
4 words animation channel direction flag [0 = left, 1 = off, 2
= right]
4 words 128 - animation channel delay in 1/60's of a second.
[0 - 128]
(I.e., subtract word from 128 to get 1/60th's of a
second.)
-----------
```

< 32066 bytes total

Compression Scheme:

PackBits compression is used (see below). Each scan line is
compressed
separately; i.e., all data for a given scan line appears before any
data
for the next scan line. The scan lines are specified from top to
bottom
(i.e., 0 is first). For each scan line, all the data for a given bit
plane
appears before any data for the next higher order bit plane. Note
that this
is identical to the IFF 'BODY' image data.
To clarify: The first data in the file will be the data for the
lowest
order bit plane of scan line zero, followed by the data for the next
higher
order bit plane of scan line zero, etc., until all bit planes have
been
specified for scan line zero. The next data in the file will be the
data
for the lowest order bit plane of scan line one, followed by the data
for
the next higher order bit plane of scan line one, etc., until all bit
planes
have been specified for all scan lines.

Caveats:

DEGAS Elite's picture loading routine places some restrictions on
compressed DEGAS files:

o Elite uses a 40-byte buffer to store data being
decompressed.

o Whenever a control command is encountered, bytes are stuffed
in this buffer.

o The buffer is only emptied when there are EXACTLY 40
characters in it.

The important conclusion here is that

No control command may cause the buffer to have more than 40
bytes in it. In other words, all control commands must end on
or before the 40-byte boundary.

Any picture violating the last condition will cause Elite to get a bus
error when the picture is loaded.

...<</PICFMT.DOC>>

eek! Basic! run away - run away! :-)

Looks something like you're drawing directly on a canvas above (I
dunno any VB btw). Have you considered a direct file conversion? I had
a quick peek at the Win95 programmer's docs. A direct conversion
doesn't seem wholly impossible. These datatypes are worth perusing...

I think the WF_KIND is a dummy for wind_ser. You must specify the window gadgets
in wind_create's first parameter.
You cannot remove or add window gadgets dynamicly once the window is created.

OK, but I wonder why not. And what is WF_KIND for, then? It's a dummy,
you say, but what does that mean? PureC's documentation suggests
otherwise:

WF_KIND legt wi_sw1 als neue Fensterkomponenten fest, Format
wie bei wind_create.

(wi_sw1 is the first parameter after WF_KIND).

Ok, sources of net2net are lost, so I want to try this way, going on patching
it until I find a start (a PC C source) to replace it completely.
There are only few problems in net2net so I this samll patches will be enough.

So: HOW TO PATCH THIS GFA .TTP program ? I am ready to listen from your
experience about:

- how to disassemble/trace the code to locate where in the program is the
part of the code that has to bee patched

- the way to redirect the calls to new routines

- how to add the new code to the program

- all other hints that can help me

The first thing I need is to make net2net write the headers in a different
way to fix the file attach programs, no you can't just change the strings
with an hex editor, because the string are not null terminated, I need longer
strings and avoid some CR/LF.

PLEASE HELP ME, this will be useful to the Atarians world I hope 8^)

I used 'think' in one of its meanings: "could as well be wrong". :-)
But one never knows, you could try if it has effect when you close the window after
the wind_set, and then open it again. May I have a guess what you are trying?
Remove sliders when they would be set to full size. ?

Do you mean wind_close() only? No, I haven't tried that. But as far as
I know, wind_open() after wind_close() tops the window, and that I
don't want. In that case I might as well use wind_delete() and
wind_create(); wind_open(); which allows me to change gadgets as I
please anyway.

You can still use goto if you give a section a label, eg:
start:

Long live the gosubs!

>
>So: HOW TO PATCH THIS GFA .TTP program ? I am ready to listen from your
>experience about:

Horrible job, however you look at it! That said, I'd try for an
approach whereby you disassemble the whole thing in such a way that an
assembler can reproduce the exact binary you started with.

>- how to disassemble/trace the code to locate where in the program is the
>part of the code that has to bee patched

Others will know of specific programs. Something called "MON" comes to
mind - iirc its a system monitor that'll trap selected OS calls, set
breakpoints etc.

>- the way to redirect the calls to new routines

Find out as much as you can about GFA's compiler. Does it generate
absolute or PC relative code, under what circumstances does it do
each, etc. You'll need to know how it treats its "stack frame" and
register usage to do anything effective.

If you have GFA then perhaps you could figure out a rough guide
yourself by compiling various bits of test code - see how it generates
a function call - that kind of thing.

>- how to add the new code to the program

A decision made based on the asm you're trying to hack at the time.
You'll need space to insert a JSR (possibly a BSR). In some
circumstances you might be able to get away with just slapping a JSR
over some code, doing your stuff, then tagging the overwritten code
onto the end of your routine before it returns. Compilers are
inefficient. You should easily be able to spot "optimisations" which
allow you to get the job done in less bytes, and thus be able to
obtain space to insert a JSR. You must know enough about the compiler
though - no good doing that if miles away there is code that jumps
directly to something you've altered (or does something even more
subtle).

>- all other hints that can help me

Given that...

1)
You can disassemble the prog such that an assembler can rebuild a byte
identical copy

2)
You've sussed enough about the compiled code to know your changes have
no side-effects

...then you can make changes to the dissassembled code. Your JSR's can
jump to code tagged onto the end of the disassembly.

Figuring out how GFA constructs function calls would be my first
approach. This at least would allow you to follow the program flow,
search for calls to "this" function and may even lead to you being
able to "hijack" a chosen function - ie pull the whole lot out of the
program body and put it elsewhere, whereby the original function space
just has a JSR/JMP to wherever you've moved it. When you can reliably
do that then you're on a winner - because you can then construct a
stack frame for your compiler and start adding the intended patch
code.

>The first thing I need is to make net2net write the headers in a different
>way to fix the file attach programs, no you can't just change the strings
>with an hex editor, because the string are not null terminated, I need longer
>strings and avoid some CR/LF.

Another thing to be figured - how GFA generates string handling code!

>PLEASE HELP ME, this will be useful to the Atarians world I hope 8^)

Good Luck!! :-))

Hello,

You might want to try ftp://atari.archive.umich.edu/, subdirs
~/Programming and ~/Languages. There are quite a lot of free C compilers in
binary form, but if you're looking for a *free* C compiler, there is gcc
(GNU C Compiler) for ST available in source. It is command-line, though.

Good luck,

Grega

3567. GFA and mouse

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-04 00:00:00 UTC
From: Grzegorz Pawlik <gp23@box43.gnet.pl>
Message-ID: <37F84E71.64C1FACD@box43.gnet.pl>
Source record: 2484

Hi

I have a little problem with my GFA BASIC program,
I wonder if you could help me. I would be *very*
grateful. The whole thing is that I cannot detect
doubleclick under TOS 2.06 (everything works
perfectly OK with TOS 1.0, though.) I'm doing it like
this:

```
-- cut here --
ON MENU BUTTON 3,1,1 GOSUB click
DO
ON MENU
LOOP
PROCEDURE click
SELECT MENU(15)
CASE 1
(singleclick occured - do.something)
CASE 2
(doubleclick occured - do.something.else)
ENDSELECT
RETURN
-- cut here ---
```

In the manual it is clearly said that in MENU(15) I should
find the number of mouseclicks. But under TOS 2.06 there
is just 0 or 1 (never 2); under GENEVA it is always
zero there.... Yes, my program does not recognise ANY
mouseclicks under Geneva. Why? I cannot resign from using
the mouse :) or even just form doubleclicks. There is nothing
wrong w/ my TOS 2.06 or Geneva, since applications like QED ,CAB
or any other work OK. In fact under GENEVA even

```
-- cut here---
ON KEY GOSUB keybp
DO
ON MENU
LOOP
--cut here---
```

does not work at all (procedure keybp is never executed.)
Those bugs happen both under the interpreter, and after
compiling the program. Please, help me, I dont know what
am I doing wrong, and I would like my program to work
not only under TOS 1.0 (who uses it now?) but also
with other systems. Please. ;)

Pozdrawiam,
Grzesiek

For over 10 years I have been programming VME Single Board Computers
(SBCs) having MC68K cpus
using the Atari. The system compiles and links a C program using the old
Megamax compiler and linker.
Another program changes the header in the compiled and linked program
and produces relocatible code.
Another program then produces an S-record file for loading into the SBC.
The system can and has been
modified for a variety of SBCs from different manufacturers. A macro
library also exists to allow
programming the MC68881/2 floating point coprocessor. I was wondering if
anyone else has interest in
such a system.

Interesting problems indeed. Only suggestion I have is to not
use the built in GFA event calls "ON MENU xxx" instead you can
accomplish the same with the EVNT_MULTI() call. The difference
being that internally GFA uses evnt_multi() anyway and it may not
be handled correctly. I alway use EVNT_MULTI() and the "ON MENU"
commands and I've not seen any problems here like you described.
I am using TOS 3.06 however.

These applications are using evnt_multi(). First you should do that,
too, because all the GFA-ON MENU-constructions are buggy. Nobody knows,
what happens inside ...

Moreover you should preconceive that mouse- and keyboard-events normally
are send to the application which is the top-windows owner. That applys
particularly in multitasking-environments.

7tc7aqqqv1@news.netvision.net.il...
> How can i tell if my 520st floppy drive is single or double side density?

It depends upon how old it is. Talking of ST or STf models, the older ones had single sided drives, maybe up to 1988. I think STe models were all double sided, but I'm not sure.

Anyway, open it and check your drive...

> How can i tell if my 520st floppy drive is single or double side density?

Seeing as this is posted to a programmer newsgroup...

Try reading a sector from a floppy disc formatted as double sided...

Something like this (using the appropriate values where noted):

#include <osbind.h>

int main( void )
{
schar8 buffer[512];

return Rwabs( READ, buffer, 1 sector, (sector 0, side 1), Drive B );
}

If Rwabs returns zero, you have a double sided drive, else if it returns
a negative number then it is a single sided drive (or else Rwabs just had
trouble reading that sector)

Seeing as this is posted to a programmer newsgroup...

Try reading a sector from a floppy disc formatted as double sided...

Something like this (I'll leave you to add the UI and so forth)

#include <osbind.h>

int main( void )
{
schar8 buffer[512];

return Floprd( buffer, 0L, 1, 0, 0, 1, 1 );
}

If Floprd returns zero, you have a double sided drive, else if it returns
a negative number then it is a single sided drive (or else Floprd just had
trouble reading that sector [in this case sector 1, tract 0, side 2 of
drive B])

MiNT checks the CPU-type, if you look in the sources I'm sure you'll find
what you're looking for.

>wind_set(0, WF_NEWDESK, NULL, 0);

That's of course the first thing I tried. But, alas, fraught with
difficulties. In the first place, the desktop is not redrawn. It is
only redrawn for the portions that are changed afterwards, i.e. when
moving or closing windows. And in the second place, the "new" desktop
is always the old-fashioned grey background instead of the coloured
background you get under a modern OS, like MagiC. So how can I get the
desktop to be redrawn, short from opening and closing a desktop-wide
window? And how do I get to the desktop currently in use by the OS?

Hi, I have 5 Atari items for sale. To make things fair for everyone,
I posted them on E-bay, so that everyone will have a fair chance.

Here's the stuff:

Atari Computer Power Supply, +5v, -12v, +12v
Atari Replacement ST Keyboard, BRAND NEW!!!
Atari "Side Board" for 810 computer NEW!!
Atari Power Adaptor Part No: C018187 11.5vdc
Atari 9 Volt AC Supply Part No: C017945

Go to this shortcut to get to my e-bay items.

http://www.elpro.com/img/

All of this stuff is in new or like new condition. Power supplies have been
tested.

Good luck.

Use a desktop-sized form_dial(). (This will also cause all currently open
windows to be redrawn)

Or just step through the WF_FIRSTXYWH/WF_NEXTXYWH list for the desktop
window, issuing form_dial() calls for that rectangle.

It had local variables!!! Quite novelty at the time, and no need for
gosub either, you could call functions by name - oo, and it also had
procedures as well. Quite Pascal-like it was. Rather handy that
co-incidence was, as Pascal was what the idea was based on!

And an assembler built into Basic.

3594. Strange Data on HD

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-10 00:00:00 UTC
From: Claus <rogge.claus@aon.at>
Message-ID: <939584650-109577AEicMi@aon.at>
Source record: 2362

I don't really know whether I have a problem or not,
but my Hard Disc is full of weird little files called
Aa,Ab or just A. They can be viewed only by three
programs I know of: Kobold (in GEMDOS-modus only),
XBoot's fontselector, CDRecorder Pro and Diskcake
(oops, well four then).
They are (what's the English name for that)
inextinguishable*, even when i've changed that on the
Desktop, I can't get rid of them. They've got sizes
like_minus_1 or_minus_65536 Bytes, are dated either
00.03.1980 or 31.15(!).2107 and seem to do no harm.
I've brought up this item in an Atariforum, and
somebody said it were dead corpses of the long
filenames enabled under MagiC - this could fit,
because they only occur on partitions that have or
have had long filenames enabled.
Anyway I am a little uneasy. Anyone having an idea or
even met and coped with tihs problem before? Thanx!
Claus

Hi!

Claus <rogge.claus@aon.at> wrote:
> I don't really know whether I have a problem or not,
> but my Hard Disc is full of weird little files called
> Aa,Ab or just A.

These are pseudo directory entries used by VFAT to store the long filenames. Unfortunately, you didn't write whether you're experiencing them with MagiC or with TOS. And I also didn't quite get what you mean with "They can be viewed": Do you mean only these programs will show those filenames, or the file contents? The latter would be quite strange, as all these VFAT entries have a start cluster of zero, which is equivalent to an empty file.

Assuming that you're seeing the entries with TOS, try HideVFAT (best first in your Auto folder, if already XBoot gets to display them). You can download it from
http://homepages.hrz.tu-darmstadt.de/~gryf/software/hvfat_r1.lzh

Besides, these entries usually don't do any harm, although trying to delete them will cause your long filenames to disappear, once you switch back to MagiC or MiNT with VFAT enabled. But, with TOS alone, HideVFAT will help you not seeing the pseudo entries anymore, so they won't disturb you. Only software that directly accesses the disk (e.g. disk editors) will not be "fooled" by HideVFAT.

Ciao

Thomas

I'm sorry for my inaccurate use of the word "viewed": It should have read
"seen" of course. I see these files with MagiC and with TOS but only on
the partitions that have or have had long filenames. So I think your
solution is perfect. I will try not to think about these files, that
really made me nervous for a while!
Thanx,
Claus

3597. PROGDEF stack

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-12 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <7tu04hjnr1@newshost.comnet.co.nz>
Source record: 2365

I am currently working on a listbox to go into my app.

As part of this listbox, I have used a PROGDEF, which will be used to
display the appropriate data.

However, I am wondering how much stack space is there that I can use
while drawing my listbox.

The code looks something like this: (in Lattice 5.60)

```
__stdargs __saveds item_listbox( PARMBLK *pbptr )
{
ItemEnum ie;

...

if( itemFind( firstitem, sizeof( ie ), &ie ) ) {
do {
...
v_gtext( handle, x, y, ie.data );

v_gtext( handle, x2, y, ie.data2 );
...
} while( itemNext( &ie ) );
}

...
}
```

The ItemEnum struct is around 250 bytes, and the itemFind/itemNext funcs
also have a local copy of the struct (which is filled in and then copied
into the one whose pointer is passed to these funcs)

All up, I'd probably need around 1k of stack space. (My TOS 3.05 machine
seems OK with that figure, but I appear to overwrite system vars used by
the AES/VDI if it gets too much beyond that)

Can I rely upon this amount as being available on all TOS versions, or are
others more/less restrictive? (I no longer have easy access to other STs,
so cannot check this out for myself)

--

All email sent to my inca address will fail, however I can now be

Sideswipe enemy racers, hang a hard left at the vertical grapple, and speed your way to the finish line! Jet Moto 3 takes you full throttle through 19 obstacle-filled, bone-smashing environments, as you attempt to conquer subterranean graveyards, ancient cities, volcanic eruptions and alien worlds. 11 insanely fast, all-terrain jet hover bikes, including new riders such as Angel and Convict, will take you on the ride of your life as you jostle, sideswipe and fight for position against the most challenging racer AI to date. You'll feel every bump, bruise and crash with the all-new 3D racing engine with MotoPhysics☐, delivering blazing fast gameplay and crisp, beautifully detailed 3D graphics. Jet Moto 3. THE RUSH IS BACK!

KEY FEATURES:
☐ Race any of the 11 ultra-realistic, all-terrain jet hover bikes. Old favorites like The Max, Wild Ride and Vampeera team with new riders such as Angel and Convict. Each rider/bike boasts his or her own performance ratings for acceleration, top speed and handling.
☐ All-new 3D racing engine with MotoPhysics☐ delivers blazing fast gameplay and beautiful 3D graphics. Experience outstanding handling and even an occasional horizontal and vertical grapple!
☐ 19 treacherous, bone-smashing environments to conquer, including an ancient Inca city, a subterranean graveyard, the gut-wrenching SkyPark, as well as the wildest, most thrilling stunt tracks ever designed!
☐ Feel the effect of eleven different racing surfaces, such as ice, wood, metal, rock, lava, grass and concrete.
☐ Experience realistic weather effects including snow, rain and night racing.
☐ Challenging AI jostle and fight for position by crowding or side-swiping other players.
☐ Rip it up or get wasted in 1 Player modes (Single Race, Season, Circuit and Practice) or 2 Player modes (Single Race or Circuit) with 4 season difficulty levels: Novice, Semi-Pro, Pro and Expert.

You could try Optimize v 2.8 it understands longfile names (Its the
prog I use on my longfile name partion, Diamond Edge on the rest
which just deletes all long filenames) I can not remember what web
site I got the prog from.

3603. ST/F030 program from PC source code?

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-15 00:00:00 UTC
From: Nurmix@socal.SPAM
Message-ID: <7u892i$1rd1@enews4.newsguy.com>
Source record: 2371

Question for the ST programming experts here:

I'm not a programmer (unless you count my BASIC days on the 8-bit Ataris), but I was wondering if anyone here might want to try converting a small PC utility program that's designed to work with Atari 8-bit files (games and such). It basically converts different 8-bit file formats to others etc.

The author has many Atari 8-bit utilities on his page, and all his source code is available as well. And he told me he has no problem with someone writing an ST/Falcon version if they're so inclined.

Anyway, if anyone is interested, I'll post here with a followup directing you to his web site and the program in question.

Thanks!

P.S. My reason for wanting this is that I have a Falcon, as well as an 8-bit Atari, and would like to convert and work with a variety of files for the 8-bit using this utility program. But unless I buy a PC, this isn't really possible.

I must be missing something obvious here but what the heck... ;-)

static ItemEnum ie;

No stack used - twice over because itemFind/Next no longer need their
local version as they'll be modifying 'ie' directly.

MagiC has a limitation also - somewhere between 110-200 chars iirc.
One of the Cab versions got caught by this. Truncate to 80 is about
the only safe way methinks.

3607. wind_update(BEG_MCTRL)

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-18 00:00:00 UTC
From: mb@gem.win.co.nz
Message-ID: <FJslyy.1H@gem.win.co.nz>
Source record: 2375

In a GEM program I am working on I use the AES wind_update() function with BEG_MCTRL and END_MCTRL to gain and release control of the mouse. This prevents mouse clicks from affecting other applications while my app has mouse control.

However I have noticed (tested under N.AES and MagiC AES) that this also has the effect of preventing screen updates. Other applications never seem to be able to draw on the screen while my application has mouse control.

I thought that was what the BEG_UPDATE and END_UPDATE arguments to wind_update() were for, but I am not using these.

Why might this be happening and how could it be avoided?

Thank you for any hints.

> Thank you for any hints.

The BEG_MCTRL includes automaticaly a BEG_UPDATE and via versa. That's because of avoiding deadlocks.
Just imagine two programs:

1. 2.
```
wind_update(BEG_MCTRL);
wind_update(BEG_UPDATE);
wind_update(BEG_UPDATE);
// couldn't perform
wind_update(BEG_MCTRL);
// could't perfom, too
// deadlock
```

Any wind_update(BEG_UPDATE) or BEG_MCTRL essentially causes all other
applications to halt in their evnt_multi() loops or when they try to do a
wind_update(). There is no reliable way around thatis that I am aware of.

: wind_update(BEG_UPDATE);
: // couldn't perform
: wind_update(BEG_MCTRL);
: // could't perfom, too
: // deadlock

Hmm, it seems somewhat pointless having both *_MCTRL and *_UPDATE modes if
they in fact both do the same thing. Is there a way around this if I want
to use only BEG/END_MCTRL without UPDATE?

The result I want to achieve is that mouse clicks would not affect other
apps but other apps could continue to run otherwise, draw on the screen
etc.

3611. What AES message?

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-19 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <7ui8j3jbb1@nnrp1.deja.com>
Source record: 2379

Hi all,

I wonder which AES message I should look for to know if a window has
been shrunken, so that it is only the moving bar left of it? This
happens if you double click the window bar in eg MagiC. I need to know
this to be sure that updating some text inputs is OK.

Please help! Anyone?

Best regards,

Joakim

Hi!

Joakim Hï¿½gberg <gokmase@my-deja.com> wrote:
> I wonder which AES message I should look for to know if a window has
> been shrunken, so that it is only the moving bar left of it?

These are WM_SHADED (22360) and WM_UNSHADED (22361). Both supply the
window handle in msg[3], and both are asynchronous, i.e. the state of
the window may have already been changed again when the message arrives.

To check whether a window is shaded, there's a little trick (the window
must be the top window for this to work): Get the first element of the
window's rectangle list (WF_FIRSTXYWH) and compare it with the window's
full size (WF_CURRXYWH). If they're not identical, the window is shaded.

I haven't tried yet, but it may be enough to check whether the first
rectangle is of height/width 0. This can't happen for a topped window,
unless it's shaded. For background windows, this is possible, so you
can't use that method reliably in this case.

Ciao

Thomas

P.S.: In case you wonder why these two message have such a high number:
They were orignally introduced by WINX, and WINX used messages
that started with 'W' to prevent collisions with existing ones
(WM_SHADED is 'WX', WF_UNSHADED is 'WY'). Fortunately, the authors
of MagiC and N.AES decided not to change them when they
implemented shading into their systems.

Cool. Primarily I am interested in his [Ken Sider's] software that takes a
bootable Atari 8-bit floppy game, and converts it to an individual FILE. I
think he puts all his source code for his various [PC] Atari 8-bit utilities
together on his page.

BTW: A second programmer [Jindrich Kubec] says he has a similar PC utility
with source code available on his site, which I've listed after Ken Sider's
information.

Anyway, here's the information:

-=-=-=-=-=-=-=-=-=-=-=-=-=-

From: "Ken Siders" <ksiders@no.spam.columbus.rr.com>
Newsgroups: comp.sys.atari.8bit
Subject: Re: Converting bootable disk games to Files

I also have source code available on my page if you are able to port it to
another platform.

Ken Siders

Did anyone of you try to compile the MIRACL library with a TOS C compiler? I tried with Pure C, but obviously some of the data types used in Pure C are not compatible with MIRACL, especially the int type: MIRACL requires a 32-bit int type (which would be long), and a double long integer type. Is there any C compiler that has double long (64-bit) integers?

First of all apologies if you have read this message in another newsgroup.

16/32 Systems are setting up a new domain with full retail catalogue. At the moment we have a basic catalog set up and will be expanding on this every day, we plan to publish articles, help files in a general area as well. I would like to make this a first or even second stop for Atari Users. The catalog at moment is fully useable and if you wish to order then please do so. Whilst we are knocking this area in to shape we will confirm each price before sending.

However I require input, please browse pages as they come if you wish and let me know what you would like to see either available or as general interest. If you wish to contribute or have any other queries please email below. If you wish just to be kept informed then email me and I will add you to the list.

The reasons for this are basically due to personal (sickness) matters I am closing my shop and concentrating on Mail Order plus Internet stuff plus my contract work. So I am going to have a lot more available time and I might as well use it.

The URL at the moment is http://catalog.zen.co.uk/actinic/16_32_SystemsX/

You can now email me on nick@1632systems.co.uk or nahrlow@cix.compulink.co.uk

Thanks for your time

Nick Harlow

3625. This old book...

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-24 00:00:00 UTC

I've got a book:

6502 Assembly Language Programming: A self-teaching guide

I'm wonder what, if any, value this has.

If the value is quite low, I'll just hang on to it as a reminder of
simpler days in the history of computing.

Cheers!
J5rson!

Ah, happy memories! This is a "bible" for the BBC micro and the Oric. The
6502 HAS been incorporated into some domestic equipment (washing machines
etc.) but you are unlikely to find much call for it now.

Roger

Hi Andrew,

GFA does work under MagiCMac. However, you�ll need a path for both interpreter and compiler. There are two patches available, one is A la card by Reiner Rosin. Have a look at http://www.rosin-datentechnik.de/rosin-online/software.html

With that, it�ll run just perfectly...

3634. STinG at maximum speed

Newsgroup: comp.sys.atari.programmer
Date: 1999-10-26 00:00:00 UTC
From: Alain GAYMARD <agaymard@club-internet.fr>
Message-ID: <38161EEB.C1B60A74@club-internet.fr>
Source record: 2402

I've written a simple client/server program for my Atari (the client).
The server is a PC running linux. The serial port is set up to 115 200
bauds. I think I can go up to 11 520 REAL bytes per second, but the
first test I've made show me it is about 47 000 REAL bytes (I'm
transfering an Atari low resolution picture, 32 000 bytes and it takes
more than 6 seconds). I'm using a socket and the average size of packets
is 1500 bytes.
I know I can compress the picture, but first I want maximum speed from
hardware. Does anybody have an idea ? Does the TCP/IP adds so much
informations to make packets ?

>
> Thanks!

I have an old SUPRA drive. I't been hacked some, as it used to be a 20Meg, and I'm not sure what it is now. probably 30 or more. Since I seldom use my ATARI equipment anymore, I'm not sure, but if you're interested let me know and I'll check into it. It has the built in ATARI to SCSI adapter mounted inside, so it's plug and play. If you'r interested, email me directly.

Didn't Ataris PC-clones in the late 1980s/early 1990s have such a port?

Or have I just mis-recalled a rumour?

If you visit my web site you can download a utility which will let you use the SLM printer using an ST as a printer server. Basically you connect the serial ports together with a null modem cable and use an HP 300dpi driver on the PC with output diverted to the serial port.

3646. CinciClassic '99 Last Update

Newsgroup: comp.sys.atari.programmer
Date: 1999-11-04 00:00:00 UTC
From: William Augustine <Augustine@c2is.com>
Message-ID: <7vsj37$8vp$1@chiapas.optimum.com>
Source record: 2414
Cross-posted to: alt.atari-jaguar.discussion,comp.sys.atari.8bit,comp.sys.atari.programmer

Only one more day until Friday, November 6 (opening night of CinciClassic)!
Response has been overwhelming!

This will likely be the final update. Check the web site or email us if
there are any pressing questions.

Tentative Schedule (all times subject to change):

Convention hours:
Friday 7pm - 10pm
Saturday 9am - 10pm
Sunday 11am - 2pm

Extra late night gameplay likely for Friday and Saturday
Sunday is typically just packing up to go
Auction 4pm Saturday
Arcade tournament Saturday until the auction (mystery game)
Other tournaments 1pm - 4pm Saturday (Bomberman plus 1 or more mystery
games)

Official web site: http://ic.net/~craig/cinci/
Phone number: (513)272-4000 (do not call before 6pm Friday)

Things you might want to bring: Power strips, small televisions, folding
chairs. Classic games for playing, trading, demonstrating, and bragging.

Here are some of the latest news items.

News item: William Moeller has announced that he may be coming to the show
to demo the INTV2PC hand controller, as well as the Intellivision Keyboard
Component and the unreleased Colecovision game "Steamroller" (written by the
author of BeamRider, David Rolfe)

News item: Current new Lynx games (PONX, Lexis, Sokomania, SFX) from
Songbird Productions and others will be for sale at CinciClassic. Also,
upcoming Jaguar games (Protector, Skyhammer) from Songbird Productions will
be available for demonstration and play.

News item: Prizes and giveaways from Hasbro, Intellivision Productions, and
others will be featured at CinciClassic.

News item: William Cassidy will be on hand to demo the Odyssey 2 multi cart
on Saturday.

News item: Many issues of Classic Gamer magazine will be given away.

News item: Several hundreds of dollars worth of tournament prizes donated by popular video game companies and private collectors will be given away.

Cincinnati weather is going to be in the mid 60's all weekend and partly sunny.

Hope to see you there!

It's a shame this stuff is going to waste. I just don't use it anymore.

SEAGATE ST-157N (45 Meg) SCSI HD $10
MAXTOR XT-8380S (380 MB) SCSI HD $50
SC-1224 Color Monitor (Minus Vid. cable) $60
Golden Image Hand Scanner (4", mono) with Scanning tray $60

I'm in Florida in the USA, and buyer must pay shipping. If interested in
any item, let me know where you are and I'll check into the mailing
cost.

3650. 16/32 System Catalogue Update

Newsgroup: comp.sys.atari.programmer
Date: 1999-11-08 00:00:00 UTC
From: nharlow@cix.compulink.co.uk
Message-ID: <807egegaq1@plutonium.compulink.co.uk>
Source record: 2418

OK, the basic web pages are now up, only two pages but it will be growing v.soon and hopefully v.fast.

The link is http://www.1632systems.co.uk from here you can link to Sales catalogue which should now be functional if a little sparse (graphically wise)

My thanks to those of you who have commented on catalogue and taking comments on board.
1) Hopefully postal rates are now sorted..
2) more graphics will be added with longer description, this will be over next two weeks.
3) On the web site, we will be archiving help files (cheats) for Falcon , Lynx and Atari games. These files will be available for download.

We do have other projects in mind so please let me know what you want to see.

Well, looks like a tremendous amount of job, as you shall have to rewrite most of BIOS and XBIOS layers of TOS ! No MMU, no WD1772 controller, no Yamaha 8192 chip (sound and parallel port), no MFP (serial port), no regular ST interrupts : every basic I/O function has to be re-written !

Might be easier to replace your non-Atari hardware by a regular ST and build the additionnal hardware required...

Warum musst du ein solches portierung ?

Good luck !

Hi Joel

Sorry, I had overlook that this is an english spoken newsgroup.

>Warum musst du ein solches portierung ?

The reason is very simple. We have a ready made 68k - handheld lcd
battery driven device and need a OS that will good work with this bit
of memory. (4MB Rom / 8MB Ram)
And I think the old TOS is a good choice for this job.

No disc or harddisc routines is necessary, only flash-rom-disc.

The problem is that all TOS's are still copyrighted and owned by companies.
No sources available.

Ok, I could answer on German but let's use good ol' English.
One of the few companies that have the TOS sources is the Milan GbR so
you should ask them.
However, there is an alternative to TOS: MiNT! It is already ported to
the Macintosh (MacMiNT) and runs most TOS programs (no GEM) quite well.
Sources for MiNT are available so you'll only have to write code which
emulates some parts of TOS. I also read that MiNT was ported to other
68K industrial machines but I'm only sure about the Mac version.

Try a web search for MacMiNT. It should have a homepage somewhere.

Greetings,
Matthias.

What kind of hardware? The uCsimm?

> weiss Tips und Infos?

Well, you can't find the sources for TOS anywhere, and since you have to
rewrite (X)BIOS entirely anyway, why not base it on MiNT? If you go
through with this, please let the rest of the world know :-) I almost
ordered a couple of uCsimms and LCD-displays in order to port MiNT myself,
but quickly came to my senses ;-) It runs Linux very well already. Btw.
that's an idea - port oAESis/oTOSis to uCLinux! Now *that* would be cool!

IMHO the best choice is TOS 2.06 (the highest rev. no for 68000)
Most of the job seems to be the removal of unnecessary parts (handling
of the FDC, DMA port...), and maybe adapting uncompatible parts
(RTC, UART... if your device has these)
next you'll have to emulate VBL interrupts and the 200Hz GEM timer if
you intend to use AES
If the ROM on your system doesn't map normal TOS adresses you'll have
to relocate the entire TOS
Last, I think the emulation of the cartridge port is the best way to
launch your applications (directly if they are <256K, or with a
ROM-disk driver if they are >256K)

You can also consider porting MiNT, but I don't know if it is
completely TOS-independant.

No, I haven't ordered any (yet). I got a mail from a fellow in California
who saw it at a Linux-convention though. I would really like to get one
for my modem, I could have an entire firewall/mailserver *inside* the
modem if I want to :-)

No.

> If not, what parts of TOS does it need ?

It currently replaces GEMDOS, but it use (X)BIOS to access the hardware.
MiNT runs on the Mac as well, the MacMiNT-people have a minimal
TOS-implementation (basically just a minimal (X)BIOS-layer above MacOS)
which I'm sure you'll find very useful. I don't have a Mac myself so I
don't know the details.

It's an enhancement of TOS, to be more specific it replaces the
GEMDOS-part of TOS. It's very unix-like, but still compatible with GEMDOS.

Exact, FreeMiNT requires the XBIOS and the BIOS to be present. The GEMDOS
is replaced and also a little bit of the BIOS, in order to be able to
manage ttys like Unix.
FreeMiNT provides a very powerful file system, really better and faster than
TOS's one.

Basically, MiNT was designed to be able to run many TOS programs at the same
time. Its creator, Eric Smith, used many things from Unix, which explains
why MiNT is so close to Unix, Linux, SunOS.

Its purpose is not to be a Unix, as there are already FreeBSD and Linux
available for this. MiNT has to run TOS programs, thus it's compatible
with Atari's GEMDOS.

But the fact is that many FreeMiNT developpers are Unix addicts and they
most work on FreeMiNT compatibility with other Unixes.
So FreeMiNT is more and more compatible with Linux, Solaris etc, and it's
still very compatible with GEMDOS.
Si you can use X11 or GEM with it !
Great isn't it ?

Vincent

> I know that there are not a lot of Atari with 020 and 010 ;-)

There are, actually.

Upgrading a 68000 machine to 68010 used to be a cool experiment
(the chips are pin-to-pin compatible, if I recall) because there
was some hint that TOS was developped on 68010-based systems at
Digital Research.

There are some accelerator cards which replace the 68000 with a
68020 + FPU (such as the Veloce+ by The Upgrade Shop in UK).

Finally, Atari clones are usually 68040 or 68060-based.

Attention Atari Programmers!

For along time now we have been needing a simple program such as a TTP that will convert Apex Media .FLC and .FLH animations and videos into common formats such as MPEG, .AVI and .MOV.

There are currently ways to do this but most of the time one has to take the FLC/FLH apart into TGA Images.

Is anyone working on a program to do this a better way?

If not, then someone should really do this.
I know that there are alot of good Atari programmers left who are capable of this. I've seen some Great Demos and etc.

Why not put all that good talent to use a create a nice program to convert Apex .FLC/.FLH files?

We also need a program to capture video and sound together from a Expose and Screen Eye and save it out into a common format such as AVI/MOV/MPEG.

Surely it cannot be that hard to do this, With all the great video players such as MPLAYER and ANIPLAY around I know that this can be done.

Hi !

i'm not sure that TOS will be happy with a 68010 or 020 inside a STF,
instead of a 68000, because format word are not supported by TOS.
(I think !)

A lot of work will be requiered to patch TOS and allow it to understand
Format word. (And somes others minors things like move from sr, became
supervisor mode).

Well, the metamail package should contain sources for that.
Additionally, recent versions of uudecode also handle base64-decoding,
so it's maybe also worth a look.

Ciao

Thomas

The original compiler library had some LineA calls in it and
some problems with the init section, all of which are easily
corrected with some patch programs. Again these fixes are
available on my gfa pages... ;-)

: (I think !)

TOS 2.06 or a patched 1.4. Although the 68010's performance improvement
is near zero.

: A lot of work will be requiered to patch TOS and allow it to understand
: Format word. (And somes others minors things like move from sr, became
: supervisor mode).

The c't did that with 1.4 for the PAK. Which replaces the 000 with a 020.
Ten years ago.
TOS 2.06 works without need for any patches.

From: Daniel Augsburger <skydiver@jumpgates.com>
Message-ID: <383D67EB.119AFF42@jumpgates.com>
Source record: 2307

I'm working on a program for MagiC that lets you change your keyboard layout anytime you wish without rebooting.
Now I'm looking for KEYTABLS.SYS files for different languages (e.g. Italian, Swedish, etc.). I already have German, Swiss German, French, English UK and English US. As the file extension is always "SYS" for every language you should also tell me for which language the keyboard layout that you send me is. AND PLEASE: if you send me a file then send also a short reply to the newsgroup to tell the other readers which "language" you sent to me (it would be best to place the language in the subject line), so I won't receive dozens of the same file. Thanx.

3691. SM_M_SPECIAL and MagiC6

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-01 00:00:00 UTC
From: Jo Even Skarstein <joska@nvg.ntnu.no>
Message-ID: <8234nu$j0j$1@snipp.uninett.no>
Source record: 2310

I'm still struggling with these, I just can't get it to work as documented:

- AES: Since MagiC 2 there is the possibility to send messages via appl_write() to the SCRENMGR (application #1) to carry out the following actions (functions as with the MagiC popup):

Tidy up (subcode SMC_TIDY_UP)
Terminate (subcode SMC_TERMINATE)
Activate (subcode SMC_SWITCH)
Freeze (subcode SMC_FREEZE)
Unfreeze (subcode SMC_UNFREEZE)
Unhide all (subcode SMC_UNHIDEALL)
Hide others (subcode SMC_HIDEOTHERS)
Hide (subcode SMC_HIDEACT)

Binding (->MT_AES.H):

```
-------------------------------------

#define SM_M_SPECIAL 101 /* MAG!X */

#define SMC_TIDY_UP 0
/* MagiC 2 */
#define SMC_TERMINATE 1 /*
MagiC 2 */
#define SMC_SWITCH 2
/* MagiC 2 */
#define SMC_FREEZE 3
/* MagiC 2 */
#define SMC_UNFREEZE 4 /*
MagiC 2 */
#define SMC_RES5 5
/* MagiC 2 */
#define SMC_UNHIDEALL 6 /*
MagiC 3.1 */
#define SMC_HIDEOTHERS 7 /*
MagiC 3.1 */
#define SMC_HIDEACT 8
/* MagiC 3.1 */

int msg[8];

msg[0] = SM_M_SPECIAL; /* 101 */
msg[1] = ap_id; /* ap_id, with SMC_TIDY_UP and SMC_UNHIDEALL own
*/
msg[2] = 0; /* No overrun */
```

```
msg[3] = 0;
msg[4] = 'MA';
msg[5] = 'GX';
msg[6] = ..subcode..;
msg[7] = 0;

appl_write(msg, 16, 1); /* apid #1 is the SCRENMGR */
```

Now, I've done all this (apart from the obvious typo in appl_write), but it still doesn't work. Sometimes the wrong application is hidden or displayed, sometimes nothing happens at all and once in a while it does what it's intended to do.

This is very frustrating, I'm sure that there is a way to get this to work as others have done it before.

HP-Penguin is written entirely in GFA Basic and a few other commercial programs. There are of course tons of Freeware/Shareware programs written in GFA.

I bought me one out of curiosity and started with some books, but
> it seems it's all very "dirty", writing directly onto the screen and
> using Line-A and so on ...
> Is it worth while?

These books are quite old. But some books feature some good algorithms which you can use in every program.

> I guess I'd need some help now and then ... anyone knowing any
adresses?

Check out run-software.de - they programmed a visual application designer for GFA called faceValue. It does most of the GEM stuff for you.

Greetings,
Matt.

Sent via Deja.com http://www.deja.com/

The following code works as expected in one of my programs:

Firstable you have to get the appl-ID of the screen manager. This is
done as follows: (you should better not rely on the assumption that the
screen manager has always ID 1)

```
sm_apid = appl_find("SCRENMGR"); // get appl-ID of screen manager
```

Note: msg[7] contains the appl-ID of the target application and not
value 0

```
msg[0] = 101; // SM_M_SPECIAL
msg[1] = gl_apid; // appl-ID of sender
msg[2] = msg[3] = 0;
msg[4] = 'MA';
msg[5] = 'GX';
msg[6] = 3; // subcode (in this example: SMC_FREEZE)
msg[7] = id; // appl-ID of application that should be freezed
```

Send message:

```
appl_write(sm_apid, 16, msg);
```

I hope this will help you.

Maybe you can help me about an old question still unresolved:

how do I start an application in "single mode" ?

I tryed different ways unsuccesfully, so maybe I need to scann all
applications, freeze them, launch the one I need "single"..... but how do I
unfreeze all of them when the application exits ?

Or should I send some kind of special call to the desktop application to tell
it to start the app in "single mode" ? I had a look at Thing docs but didn't
find the right info.

3695. need Atari 1040ST drives

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-03 00:00:00 UTC
From: Joseph Zorzin <redoak@forestmeister.com>
Message-ID: <3847E338.15B38BC4@forestmeister.com>
Source record: 2314
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer,comp.sys.atari.st

I need, preferably an ST hard drive, or at least an external floppy.

Until 1993 or so, I used a 1040St with an external floppy and a custom build hard drive. The hard drive died, and then I bought a Pentium.

But I programmed on ST and have a need to update some old software that I created back then.

So, I'm looking for a hard drive for the ST, either an ST hard drive or a custom built one. I'd also need whatever software it would take to get the hard drive working. I doubt that I could find whatever I used back then.

If I can't find a hard drive, I'll consider buying an external floppy. Shortly after my hard drive died, I continued to program using 2 floppies. But now I can't get that old external floppy to work. The light comes on and I can hear a hum, but it won't read any floppies. Might it be reparable, or maybe it just needs a good cleaning?

I've got Gemulator98 installed on my PC but so far I've had no luck in getting my Megamax Laser C to work with, even with the help of the author of Gemulator. The author of Gemulator says he uses Laser C on his PC but for me- it crashes Gemulator. Any advice on this issue?

Even if I can get Laser C working on Gemulator, I'll have another problem- getting my HP4p printer to think it's an ancient HP FX printer. HP sells an FX emulator for the 4p laserjet, but for $200!

3699. [Q]x2: sides on a floppy disk

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-06 00:00:00 UTC
From: Guillaume Déflache <guillaumed@europe.com>
Message-ID: <384B9EA9.AF130EE6@europe.com>
Source record: 2318

```
1) Does someone know how a two-side floppy disk is organized in a .ST
file?
Is it :
- track <n>, sector 1, side 0
- track <n>, sector 1, side 1
...
- track <n>, sector <NSEC>, side 0
- track <n>, sector <NSEC>, side 1
or:
- track <n>, sector 1, side 0
...
- track <n>, sector <NSEC>, side 0
- track <n>, sector 1, side 1
...
- track <n>, sector <NSEC>, side 1
or something other?

2) Is it possible to READ the bit of the YM-register giving the selected
side of the floppy drive? It was not clearly stated in docs I have...

Thanks by advance !
```

3700. [Q] 0xffff860e WORD register on Falcon???

Newsgroup: comp.sys.atari.programmer

From: Guillaume Déflache <guillaumed@europe.com>
Message-ID: <384BA12D.129572CD@europe.com>
Source record: 2319

Does someone knows what this register is for? It is written to as a word
value in my TOS 4.02 (Falcon) ROM.
It appears only in Dan Hollis' (or is it Aura's) register listing? with
no comments whatsoever (and ICYW it is not in the Compendium).

Thanks by advance

3702. NO LONGER MISSING! Adventure International Masters, alphas, and other stuff available...

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-06 00:00:00 UTC
From: DauthiSlayer <Piratedman@hotmail.com>
Message-ID: <s4oe7gffqeg50@corp.supernews.com>
Source record: 2321
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.programmer,comp.sys.atari.st,comp.sys.atari.st.tech

==========

A few years back- I came across, a large group of Adventure International, software etc. Basically I've got boxes and boxes of disc- in small cases) usually it's one game per case- and within the case are usually 3-6 disc. Some of these are normally alpha or "prototype" versions of the game and it usually contains what is labeled a "Master" disc.
AI had been based in the Orlando area, and this stuff had been placed in storage and ultimately sold for non-payment of rent. It would seem that this was the Adventure International "archives" or perhaps the separate backup storage- that was then lost or abandoned, Much of the stuff is AI, but some is under another name- so I suspect that they either succeeded Scott Adams' Adventure International- or perhaps obtained the rights to some of the stuff.(or were a spin-off).
I got only about 1/3 of what was available- but it includes Atari 8 bit, St, Commodore, 64, TRS-80 etc. But still there are probably 100 or so separate cases- and maybe 500 separate disc.
There is also some cassette based software.

My interest is primarily the cartridge based games....
Any idea what this stuff is worth?
Offers? ....
I'd rather move this as a group/lot-
But if there is some particular title- you really have to have- if your offer will make it worth my while, I'll pull all this stuff out and search through it for specifics.

3703. Gemulator and Megamax Laser C work together?

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-06 00:00:00 UTC
From: Joseph Zorzin <redoak@forestmeister.com>
Message-ID: <384C6BF3.6BD7687C@forestmeister.com>
Source record: 2322
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.programmer

I downloaded Gemulator 98 and 2 versions of TOS, 1.04 and 2.06. I manage to get Gemulator to see both and then I've been able to run many of my old Atari programs but I'm have trouble with the Laser C development program.

Laser C loads- but- if I have Gemulator use 14 megs of RAM, Laser C will crash trying to open any code file or when attempting to make changes to it's config.sys file.

So, I adjusted Gemulator to only use 4 megs of ram on my Pentium, and now the above problem doesn't occur, but when I tried to compile a code file- it crashed and burned my PC operating system (Win95 OSR2)- I ended up with a black screen. I had to reboot, run scandisk, and it fixed a damaged file.

I don't get it. The author of Gemulator says it should work. I got a few messages from him, but few suggestions, and he seems to have given up on this problem.

The reason I still care to develop software with GEM and TOS is that I wrote some software that I've come to depend on in my conulting work. I now also have MS Visual C++, but that's a steep learing curve before I'm ready to try porting over GEM programs to Windows- I'll do it eventually, but in the short term I'd like to continue with TOS and GEM.

Anyone have any suggestions?

The Catalogue now has over 500 separate Atari Items.

1) New section of unboxed Lynx Games
2) New section starting for TT compatible game (feedback appreciated)
3) CD section mostly finished

Next will be working on the Utilities Section.

I plan for a pdf version of the catalogue or even a downloadable html...
comments?

So visit the site and somepoint and let me have your comments, feedback
appreciated. info@1632systems.co.uk

http://www.1632systems.co.uk for the home pages, which are still being
worked on.

http://catalog.zen.co.uk/actinic/1632Systems/ for the sales catalogue

Hi Nick

I think the pages are coming along fine but please do not use pdf,
I think html is better and above all slimmer. If you turn it into pdf
it gets 10 times bigger (not quite, but) and it isn't better in any
way.

3710. CAB programming

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-08 00:00:00 UTC
From: mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it
Message-ID: <11112_mike@bbsgate.interware.R.E.M.O.V.E.T.O.R.E.P.L.Y.it>
Source record: 2329

I am trying to complete the job to make Atari NOS work with CAB.

I implemented in NOS the functions to get info and files from URLs. I start CAB in parallel in MagiC with SHEL_WRITE. All works well requesting urls and displaying sites in CAB (1.5).

Then I added the feature to do a post, to write in forms and send data receiving answers (search engines).

The problem is this: when CAB requests an URL the control goes to NOS, CAB becomes "freezed", all menus grayed out, no reaction to clicks or other events, so you can't even stop the actual trasnfer. THis is boring explecially if the site does not give an answer and you have to wait for NOS going to timeout.

Now I see there are some functions in CAB involving the AES, to display the actual status and this is good, but what about functions to send AES messages ?

NOS is now a GEM program with its own evnt_multi, what should I do to keep CAB alive while NOS is doing the transfers ? This way you can interact with the CAB window while downloading pages, and stop the actual transfers (I hope).

I see for a good browser cooperation I should write my own browser, is there any free code around ? Don't say Natscape, I can't start from it 8^)

Can you give me the email address of Alexander Clauss ? He may help me in this process.

Ciao, ** *Mike* ** www.interware.it/users/mike/ mike@interware.it

You can use a SCSI-I with an adapter called "The Link". Perhaps
SCSI-II with "The LinkII" but I'm not sure about that.

>If I can't find a hard drive, I'll consider buying an external

Try it on another emulator. See if it crashes there. You never know,
something in MegaMx may have got corrupted if it's been sat a while.

The programming interface is the same.

>> Atari NOS w
rc> I'm sorry, never heard about NOS! What's that? "New Operating System"?
rc> Something we haven't heard about in Europe?

Oh no, it's really famous and used, it's NOS = Network Operating System also
known as KA9Q, very popular for packet radio.

>> CAB alive while NOS is doing the transfers ?
rc> Any way of telling CAB to give over control? If your NOS is an
rc> Internet program, CAB is able to let over (like: Fiffi for FTP, EMailer
rc> for E- mails . . .)

It is not CAB that has to give control, the problem is the opposite: cab
requestes a web page calling a NOS function, that does not return until the
page is saved in the cache. Maybe this is how CAB works, i.e. it freezes
until each object is completely received or timeout, but I think it works
better with sting or Iconnect, but how ?

3716. Message queue

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-10 00:00:00 UTC
From: gmiller@inca.co.nz
Message-ID: <82rtnrkps1@newshost.comnet.co.nz>
Source record: 2335

How deep is the AES message queue for each app?

I open a window and send myself a MN_SELECTED message - all before entering the main message queue.

By my reckoning, that'd be two messages in the apps queue (the WM_REDRAW and my MN_SELECTED), however it appears that the sending of the MN_SELECTED message causes the computer to crash in, or just after, the appl_write call used to send myself the menu message.

I am sending the requisite 16 bytes, and the data within the message is all correct.

If I change it to calling my own mn_selected() function, bypassing the apps message loop, this problem doesn't occur.

This occurs under AES 4.1 when running under MINT and when singletasking.

--

All email sent to my inca address will fail, however I can now be contacted via an intermediary : gem at gem win co nz. I would like to apologise to the genuine respondents that this may inconvenience.

>
>Anyone have any suggestions?

Any decent emulator should _not_ crash the host OS, no matter what
the emulated programs do... (well ok, unless you allow direct
hardware access.) I'd try a different one... I use (rarely now,
but it is still installed) stonx, tho that may not be the right one
for you as its a unix program, running on FreeBSD here. (Unless
of course you want to put a unix or linux on your box besides the
windows but that would be a bit off-topic here. Here's a link:

http://www.freebsd.org)

What you could also try is a cross compiler, that would make the compilations faster too as there's no emulation involved for that anymore. gcc (GNU C, free) can be configured as a cross compiler and there is a windows port of it too (called cywgin), although i must say i haven't yet tried building a cross compilier on cygwin myself, i have only done it on unix. (i was tired of waiting ages for the compiles on the slow 68000...) I also remebmer i had to apply external patches for the atari object format etc. (gcc itself only knew the 680xx CPUs but not atari TOS) and atari binutils, i think i still have the stuff somewhere on a CD but of course as it is now several years old the patches will surely no longer apply to the current gcc so you'd better look for a more recent version yourself. (Or does someone here know where that could be found now?) It _may_ also be that gcc now actually supports TOS by itself (or MiNT, that should also work), but somehow i doubt it...

HTH,

3719. Atari 2600/5200/7800/8-bit auction ends Sunday the 12'th

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-11 00:00:00 UTC
From: csjjh@ux1
Message-ID: <38528058@news.eiu.edu>
Source record: 2338

Hi there,
I've got the following auctions going on at e-bay for the Atari 2600
(VCS), Atari 5200, Atari 7800 & Atari 400/800 8-Bit computers. The really
big find here is Kool-Aid Man with box & instructions for the 2600.

To check the status of all my games go to:
http://cgi3.ebay.com/aw-cgi/eBayISAPI.dll?ViewListedItems&userid=csjjh@eiu.edu

Once there, just click on the itme number to see a full discription &
place a bid if you like.

ATARI 2600 (VCS)
Item # End date/time Bid Game discription
------ ------------ ------ ----------------
216037614 12/12/99 14:24 $0.01 AIR SEA BATTLE

In uno strano messaggio del 11 Dec 99 maxilys@normandnet.fr (2:333/608.1)
scrisse al povero Mike De.Petris:
m> Here we go! There comes ClockPoV as promised.

Oh, finally things get clearer on this subject too! Your program does not
work here ! GEM programs are started in "chain mode" so start only after
ClockPov is closed. TOS program does not start, and freeze ClockPov because a
"single mode" is used.

The problem is not in passing tail and exec strings, this is just a different
convenction of C and GFA I think, but a different way of working of
shel_write. Have a look at the rest of the message to see the content of
SINGLE.TXT that explains the start of programs in MagiC, you will find it is
different from what you are doing. You should find a similar document about
MiNT to send me to try to find the way to make it work in both environments.

BTW I think this experiment has already been done, and someone should have an
answer to start a parallel program in both MagiC and MiNT.

```
-------------------------- START OF CUT --------------------------
Description of "single mode" of Mag!X
====================================

Position: Mag!X 1.12
Andreas Kromke, 4.3.93
English translation: Peter West, April 99

Mag!X distinguishes between three differently paired types of applications:

a) The application #0
b) Accessories
c) Other applications (ap_id > 0)

The following call serves for launching programs under Mag!X:

*
* int shel_write(int doex, int isgr, int isover, char *cmd, char *tail)
*

Warning: MultiTOS works in a way that is completely incompatible to
previous TOS versions. The new calls are controled via <doex>
(0 here is program launch with automatic isgr-identifier and
1 with manual isgr-identifier, etc.) while "isover", which is
called "iscr" here, controls the ARGV passing.

Thre are 5 different possibilities to launch applications from within
others ("magx.h"). Here are the parameter values for <isover>:
```

* #define SHW_IMMED 0 /* PC-GEM 2.x */
* #define SHW_CHAIN 1 /* TOS */
* #define SHW_DOS 2 /* PC-GEM 2.x */
* #define SHW_PARALLEL 100 /* MAGIX */
* #define SHW_SINGLE 101 /* MAGIX */

Of these, modes 0 and 2 are not supported by Mag!X. <doex> must always be 1, otherwise only previous shel_write() calls will be revoked (as in TOS 1.04).

1. SHW_PARALLEL
A new application will be created. It inherits all standard paths and files from the current application. The new application runs in parallel to the previous one. One will only get an error code if a memory shortage occured during set-up. There is no message at the termination of the new application (no "death-of-child").
2. SHW_CHAIN
This is the procedure under TOS. The program makes the call, and after terminating itself the AES launches the new program. SHW_CHAIN does not work with desk accessories, as these must never be permitted to terminate.
The new program inherits the standard paths and files that the previous program had at the time of its launch. In general these are in turn the ones that the program had that earlier launched the "ancestor" of the application with SHW_PARALLEL. In the case of application #0 therefore the new program gets the standard paths of the AES.
If DESKTOP.APP (shell of GEM 2.2) is installed as a shell, then Mag!X will insert the current path and drive before the filename.
3. SHW_SINGLE
Works like SHW_CHAIN, with the exception that before calling the program all applications apart from application #0 and #1 (SCRENMGR) are frozen. The programs are unfrozen once more after the program terminates as long as it did not make a new shel_write() call with SHW_SINGLE on its part.
One should add that from Mag!X 2.00 onward when calling shel_write in SHW_SINGLE mode the current paths of the caller are passed to the parent and hence to the new program. Warning: The paths of the calling program are destroyed after this, though this is not critical as the call following shel_write is generally a Pterm.

The loops for SHW_CHAIN and SHW_SINGLE look like this:

For application with ap_id > 0:

```
while(doex)
start(isgr, cmd, tail);
```

For application #0:

```
while(world_is_turning)
{
start_desktop();
```

```
while(doex)
{
if (single_mode && single_mode_not_yet_activated)
activate_single_mode;
else unfreeze_programs_if_appropriate;
start(isgr, cmd, tail);
}
unfreeze_programs_if_appropriate;
}
```

How do I launch a program in "single mode"?:

a) Ensure that I am application #0 (i.e. ap_id == 0).
b) Set paths and drive for the new program.
c) shel_write(TRUE, isgr, SHW_SINGLE, cmd, path);
d) All important settings to temporary file or shell-buffer.
e) appl_exit()/v_clsvwk()/Pterm0.

How do I launch a program in "chain mode"?:

a) If appropriate set paths and drive for the new program and make a
call
shel_write(TRUE, dummy, SHW_SINGLE, dummy2, dummy3);
in order to set the paths for the new program (incompatible to TOS).
b) shel_write(TRUE, isgr, SHW_CHAIN, cmd, path);
d) All important settings to temporary file or shell-buffer.
d) appl_exit()/v_clsvwk()/Pterm0.

After the program terminates the shell will be reloaded automatically.
When calling the shell one gets in the command line (->shel_read) the
"magic" sequence (magx.h):

```
/* tail for default shell */

typedef struct
{
int dummy; /* a null-word */
long magic; /* 'SHEL', if it's a shell */
int isfirst; /* first call of the shell */
long lasterr; /* last error */
int wasgr; /* program was a graphic-app. */
} SHELTAIL;
```

If <isfirst> is set then the status is to be read from something like
DESKTOP.INF, if <isfirst> is not set then one takes the temporary file or
shell-buffer.
<lasterr> is the return value of the program running previously. If this
was a GEM program then the error will already have been displayed in an
alert box. It is well known that the longword is negative if the error
occurred with Pexec itself; a program return value always has the high
word 0.
---------- END OF CUT ----------

Although the message pipe is ludicrously small under standard Gem (I
forget what) it isn't *that* small. My guess here is that the
MN_SELECTED is causing the AES to lock the screen manager. You could
perhaps verify this (or not) by changing that MN_SELECTED to (say) a
WM_RESIZE and see what the result of that is?

I dunno the format of a .ST file I'm afraid, but it would seem
reasonable if it followed the same arrangement as the floppy it came
off, whatever that happened to be according to the BPB in the boot
sector.

>2) Is it possible to READ the bit of the YM-register giving the selected

Kind of widely xposted, but could you give a bit more info about your
problem?

For instance, the Atari has built in floating point and most people would
just use that, but we don't even know the range of numbers you need or even
if you need floating point answers.

I don't need some routines that pull a squareroot and leave a 128 bit
integer value or so.
Just things like:
Pull squareroot of a 16 bit number and leave a 16 bit result in the
zeropage and rest in Accu or something like that.
Or multiply two 8 bit numbers to a 16 bit result.
Divide 16 bit number by a 16 bit number and leave result in 16 bit
Zeropage-adress plus rest in the accu.
I have division and multiply routines here, but they are very slow
because they use ROL and ROR.
What I need is especially the routine for pulling a squareroot and maybe
2 routines for division and multiplication that are very fast.

And the important thing is that it runs on a plain 6502 (which has no
floating point instructions).

-Wanja-

--
In the 1960s you needed the power of two C64s to get a
rocket to the moon. Now you need a machine which is a vast
number of times more powerful just to run the most popular GUI.

OK, this one is fairly easy. The square root of any 16 bit number will be 8
bits or less. The easiest way to do this is a table with precalculated
numbers.
result/from range
0/0
1/1-3
2/2-8
3/9-15
4/16-24
...
You need a table with 256 results/bytes, and the ranges are defined by 512
16 bit numbers. For ~1200 bytes of table and probably less then 50 bytes of
code for the decision making, it should be the fastest way to go.

> Or multiply two 8 bit numbers to a 16 bit result.
I am kind of cheesy when it comes to this kind of stuff. I usually just have
simple routines like mutiply by two, then call it twice to get times 4, 3
times to get times 8, ...
Ditto for times 3.
So times 6 becomes call 2x routine once, 3x routine once etcetera.

For good routines, do you have access to Levanthal, Assembly Language Subroutines for the 6502? I think that is the title and it has everything you ask for, 16 bit math, BCD, ...

The only other sources I can think of, at least from the Atari side would be the Public Domain Action! runtime package. There may be some others, I think Charles Brannon's<?> assembler for the C64/Atari in Compute included math routines so you could do things like.
LDA AVAR/$FF
It should be pretty easy to 'borrow' his routines for multiply and dividing 16 bit numbers.

If you're into a little homework, Microchip (www.microchip.com) has assembly source available for 24 and 32 bit floating point. I've only used basic functions, but they've other functions (including square root, IIRC). The routines are pretty short and have well specified runtime properties.

The tricky part will decyphering the evil assembly mnemonics and adapting them to the 6502. It could be argued that PICs have an encrypted native instruction set given the strange properties of the processor... ;)

There does exist a "fast floating point" set of routines for the Atari
8-bit. I'm not sure which functions are supported.

Hehe, strange way to get sourcecodes but I'll check that.

3732. problems using tos-port of gcc

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-19 00:00:00 UTC
From: Matthias Reis <matthias.reis@musikschule.net>
Message-ID: <385D475F.590B9BCA@musikschule.net>
Source record: 2252

Hi!
I have a problem with the atari-port of gcc. The compiler runs
correctly, if my code is not preprocessed (I get only a message of
unknown # commands, but that is ok). But if I try to compile
preprocessed code, I get the nasty atari-bombs (the compiler chrashes).
I tried also g++ with the same effect.

Thanks,
Matze

I hate to say this, but using those 2 instructions is the only way to go unless you have a large table. I had to work out percentages using ML. I looked at what was around, routines etc and how fast I wanted them to go. Finally settled on using the OS floating point routines to do the multiply and divide. I wanted a decimal point in the calculation and speed was not an issue. And it was slightly eaiser to convert BCD to screen bytes.

Greetings all,

There are now 3 completely new archives, and 2 of the old ones are
updated with more icons. Check out the nice 48x48 icons in archive 37
and also the animated cartoons in archive 39.

Stay tuned for more! ;)

But DO NOT stop reading now! I would very much like inputs from atari
users all over. What do you think about the icon library? Give me some
feedback, so I can keep imnproving the site. Thanks! :)

Now you can go see the icons: http://gokmase.atari.org

Regards,

Joakim

Registers d0 to d7 are data registers and hold 32 bits of integer.
"for" is a loop, here for 16 iterations (the number of bits in the result).
"move" moves the left operand to the right one. "lsr" is "logical shift right",
shifts the LSB into the carry, but does not shift in the carry into the
number, but a zero. "lsl" shifts leftwards, the amount given in implicit
addressing. Again, the MSB goes into the carry, the LSB will be blanked.

"cmp" compares two operands, the right one with the left one, sets carry
accordingly (and just the other way round compared to the strange 6502 carry
logic). "bhi" means "branch if higher than". "add" and "addq" are addition
commands, adds the left operand to the right one, NOT including the carry, but
setting the carry. "roxl" shifts leftwards, thru the carry like the 6502
rol does, except that it is 32 bit. "subq" and "sub" subtract the left
operand from the right one, again ignoring the carry, but setting it.

Nice exercise to think about how this algorithm works. I leave this as an
exercise to the reader. ((-;

Greetings, Happy New Year,

Thomas

Nope, I have no idea.. could be that the few programmers left know their
machine by now :) Its too bad that the traffic is so slow anyway. But I'm
sure if you ask, you'll get answers :)

3749. emulators - GEM2000? - ST utility for TOS on disk

Newsgroup: comp.sys.atari.programmer
Date: 1999-12-30 00:00:00 UTC
From: Mustafa Soysal <test@umich.edu>
Message-ID: <1iLa4.4104$b5.680316@news.itd.umich.edu>
Source record: 2268
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st,comp.sys.atari.programmer

Greetings,

I am looking for emulation packages that run on W98/NT4. In particular, I am looking into running it on a W98 laptop.

GEM2000 by Emulators, Inc. seems to require either a hardware extension with the TOS ROM's plugged in, or the TOS images on disk. For laptops, they recommend the disk image.

Are there any TOS utilities to extract the TOS image from the ROM? I don't know which version it will be, we have several different ones we may have to try.

What are the image requirements (Lo, Hi, headers etc?) I may be able to write such program (I forgot if the ST let you access the ROM contents without giving you an access exception - and I also don't know what address the ROM started and where it ended). Information would be very appreciated.

If you were looking for an archive, which ftp site would you look at these days?

Help is greatly appreciated.

Best Regards,

Mustafa Soysal

Anybody ever managed to assemble an executable of 1.4Mb using Genst 3?

The file is ok upto 1.1 Mb and Genst assembles really quickly at the size. When the size gets bigger the resultant file screws up and Genst takes about 2 minutes to assemble.

I have tried all sorts to sort it out but it still won't assemble my code. I don't want to recode my demo just 'cos of a feature.

I've just been reading my way through an Emulator FAQ at
http://members.aol.com/rg1004/atstemu.faq.html which gives some ideas, and
URLs (which I haven't had time to try yet).

I'm looking for the same thing..an ST emulator I can use on an old 486DX to
develop software for an ST520 that I've just bought.

Does anyone know of a good free programming environment (Basic or Pascal
prefered) for the ST?

Thanks

Paul Cull

Actually, some of the links in that FAQ are old. The Little Green Desktop at
http://www.pacifist.fatal-design.com/ is probably the best place to start an
emulator pilgramage, IMHO.

Source record: 2272

Hi,

I am trying to call BubbleGEM from within a program of mine but have
experienced problems under MagiC, but under Geneva it seems to work OK.
Under MagiC it seems like it only works a couple of times, and then no
program is able to call the bubbles.

This is what I did: (after checking that "BUBBLE " really is started)

1) Wait for request (time-triggered) from BubbleGEM
2) Recieve memory and send BUBBLE_VIEW back to BubbleGEM
3) Wait for BubbleGEM to send BUBBLE_ACK (saying "bubble is closed")
4) Release memory

What am I possibly doing wrong here? Have I misunderstood something
here?

Thanks in advance,

Joakim

I don't know if GNU has Pascal, but their gcc was pretty good for command
line programs.

Doesnt GENST use a hard disk partition for compiling, have you got paths
set right, you might be running out of memory and having no swap space is
killing things.

Genst makes the executable (assemble to disk) and it is 1.4Mb in size.
I cannot assemble to memory as Genst has a limit of 999K.

More news...

When the exe file is 1.2Mb it runs ok, when it is 1.4Mb I get 4 bombs
(illegal instruction).
Because it is running on a Falcon I cannot run AMONST so debug it.

I have tried all sorts of things on this and I believe it is a bug in Genst
that is causing a bad output file.

I am going to try splitting the INCBIN parts to a file and the actual code
into another then joining the two.
I may also try the standalone assembler version (TTP file).

I'll let you know.

Mark

3764. Re: Genst problems

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-01 00:00:00 UTC
From: Mark Davies <pov@tesco.net>
Message-ID: <84m05q$ot5$1@epos.tesco.net>
Source record: 2283

I have fixed it.

First of all I had used a SECTION DATA and a SECTION BSS but I had not
declared the SECTION TEXT.
After I had made the change I got Genst to assemble to 1.2Mb.

When I tried to assemble to 1.4Mb I got a working exe but there were some
graphics missing...

By trial and error I figured out the Genst has a limit on the size the DATA
segment can be. I increased the TEXT segment which decreased the DATA
segment and ... IT WORKED!

I now have a 1.4Mb working exe (PRG) file.

Now all I have to do is get my demo working on RGB as well as VGA.

Any Falcon 030 owners out there who fancy testing a demo for me?

Mark

Atari shipped the devkits with Digital Research "C" at least that
is what is in my kit from Atari. I think also they may have at one
time included Mark Williams "C" or Acylon "C" (<-spelling?).

3773. 3d-objects again....

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-05 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <84ufa2$379$1@nnrp1.deja.com>
Source record: 2292

Hi all,

I am struggling with positioning gem objects correctly under different
AES'. Someone previously mentioned that if FORM_CENTER is used, you can
learn what the real size (including all kind of borders) are.
Unfortunately it seems like if that won't work with N.AES. :(

I thought I might check if the AES if able of viewing 3d-objects, since
I then believe there is a call that can return true size of an object.
Making such a call would certainly crash an older AES version?

Anyone been doing this withing GFA by any chance?

Thanks in advance,

Joakim

You can look at AES version # and determine if certain calls
are available. I think appl_getinfo() can tell you part of
what you want to know. Also objc_sysvar() is the other one you
might need. I wish I had an example how this was done as I've
only ever read about it, and never tried it.

Imo there's no really satisfactory way of doing this, especially as
I've a personal dislike of writing code that goes like this...

"if OS=x THEN do A ELSE IF OS=y THEN do B ELSE etc".

The best I came up with relies on centering the object with
form_center(). This obtains the clipping area (which may be larger
than is needed). This clipping area is then adjusted so that the
object can appear at the desired place onscreen.

void
Form_Move(x,y,ob)
int x,y;
OBJECT *ob;
/*[ void Form_Move(x,y,ob)
int x,y;
OBJECT *ob;

Form_Move() performs a similar task to form_center() except that x,y
specify
the absolute screen position for the tree. ob and cp are changed to
reflect
the new screen position. form_center() is called to ascertain the
offsets
required from the object position and the clipping rectangle, after
which the
object is repositioned. Passing a negative value for x or y results
in it
being left unchanged after the form_center() call, so passing both as
negative
is effectively a form_center() call.

Note that the form is clipped to the desktop workarea.
]*/
{Rect rr0,
rr1,
```

```
cr;
Prect cp ={&cr.x,&cr.y,&cr.w,&cr.h};

/* find the save area */
form_center(ob,cp);
if (x >= 0) {
*cp.x = x - (ob[0].ob_x - *cp.x);
ob[0].ob_x = x;
}
if (y >= 0) {
*cp.y = y - (ob[0].ob_y - *cp.y);
ob[0].ob_y = y;
}

wind_get(WH_DESKTOP,WF_WORKXYWH,&rr0.x,&rr0.y,&rr0.w,&rr0.h);
rr1.x = *cp.x;
rr1.y = *cp.y;
rr1.w = *cp.w;
rr1.h = *cp.h;
rc_intersect(&rr0,&rr1);
*cp.x = rr1.x;
*cp.y = rr1.y;
*cp.w = rr1.w;
*cp.h = rr1.h;
}

int
rc_intersect(p1, p2)
register GRECT *p1, *p2;
{
register int tx, ty, tw, th;

tw = min(p2->g_x + p2->g_w, p1->g_x + p1->g_w);
th = min(p2->g_y + p2->g_h, p1->g_y + p1->g_h);
tx = max(p2->g_x, p1->g_x);
ty = max(p2->g_y, p1->g_y);
p2->g_x = tx;
p2->g_y = ty;
p2->g_w = tw - tx;
p2->g_h = th - ty;
return( (tw > tx) && (th > ty) );
}

typedef struct grect
{
int g_x;
int g_y;
int g_w;
int g_h;
} GRECT;
```

```
typedef struct { int x, y, w, h; } Rect;
typedef struct { int *x, *y, *w, *h; } Prect;
```

Btw, sizeof(int)==2 above.

>I thought I might check if the AES if able of viewing 3d-objects, since
>I then believe there is a call that can return true size of an object.
>Making such a call would certainly crash an older AES version?

I struggled with this, spent ages massaging things, only to have it all fall over when I added another feature. It became a nightmare until I stood back and thought about *why* I wanted to know exact sizes. Turns out that if you're prepared to dispense with features that extend outward of the ROOT OBJECT's area ('area' as described in the OBJECT structure) then all difficulties vanish - because you can use the OBJECT area directly. Consider this...

The ROOT object can now be positioned exactly. Restating the obvious: the child objects, being relative to the ROOT, are also positioned exactly. The key to this is the redraw - the AES has to do it and whenever you manipulate a child object don't have the AES objc_draw() the child, have it redraw the parent of the child. By redrawing the parent you also ensure that features of the child which extend outward from the child will be visually correct.

Imagine you have a ROOT object which has, amongst other things, an I_BOX with three buttons under gawd knows what OS. They might be 2D or 3D visually. Say one of the buttons has OUTLINED status and thus extends outwards of its actual OBJECT dimensions. This may also be the case with the 2D/3D features - we don't know and we don't care! Lets say also, that when you click this OUTLINED button, the OUTLINED status wants removing, and that you want to add a fourth button and adjust the spacing so they are spaced equally...

You use the actual OBJECT areas of the buttons and the actual OBJECT area of the I_BOX to calculate your spacing - nothing difficult there, and now you clear the OUTLINED status of that button. Redraw the I_BOX with objc_draw() to MAX_DEPTH using the I_BOX area as the clipping rectangle. Job done.

The price paid for this technique is you cannot guarantee "visual preciseness". In those (rare) instances where it is important you can always test the OS on startup and load a resource file dedicated to that OS's display habits.

>Anyone been doing this withing GFA by any chance?

Not me I'm afraid.

Not exactly what you wanted but I hope it helps. ;-)

I don't see why it would not, worst case senerio is you may be forced to
to use an old ST mode to make the editor work. However what you code
and compile would not necessarily have the same problem, depending
on your own code of course. ;-)

Source record: 2110

Hi!
I'm trying to compile a self-made unit in Pure Pascal 1.1 and can't find out how to do it. I had to give the file a name before writing it, and i called it "ppu" right from the start. This does not seem to be the (only) fault, though.
All the entries under "compiler" are grey when I'm in the editor with this text.
Anyone able to give a hint to a beginner like me?
Claus

3792. Re: [aide en GFA 'Basepage']

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-09 00:00:00 UTC

Source record: 2111

From the GFA-Basic Manual :-)
Hope this helps...

BASEPAGE
HIMEN

In the variable BASEPAGE is the address of the Basepage of the GFA-Basic
Interpreter, BASEPAGE is a 256-byte long storage area as follows:

Bytes Contents
0 to 3 Address ofthe start of TPA (Transient Program Area)
4 to 7 Address of the end of TPA plus 1
8 to 11 Address of Text segment of the program
12 to 15 Length of the Text segment
16 to 19 Address ofthe Data segment
20 to 23 Length of the Data segment
24 to 27 Address of the BSS (Block Storage Segment)
28 to 31 Length ofthe BSS
32 to 35 Address of the DTA (Disk Transfer Address)
36 to 39 Address ofthe Basepage of the calling program
40 to 43 Reserved
44 to 47 Address of the Environment Strings
48 to 127 Reserved
128 to 255 Command line (first byte specifies length of command text)

The variable HIMEM gives the address of the first free memory location not
used by GFA-Basic. This is normally 16384 bytes below the screen area.

Example:

```
a%=LONG{BASEPAGE+&H2c}
DO
a$=CHAR{a%}
EXIT IF LEN(a$)=0
PRINT a$
ADD a%,SUCC(LEN(a$)) ! SUCC() = next higher integer
LOOP
```

--> Here the complete BASIC Environment is displayed.

Memo: This pointer should be avoided. If you need additional ram see
MALLOC().

A sourcefile should be given a name like "anything.pas", which will then be
compiled to "anything.ppu"
Not having the .pas extension is the cause of the greying.

I just wanted to let people know that I was able to sneak in a quick mention of the Atari 800 in my latest article. It is nothing big, but I write for "PC AI" magazine (www.pcai.com/pcai) and my latest article, "Exploring MARS: An Alternative to Neural Networks" appears in the Jan./Feb., 2000 issue. In it, I described MARS, which is a machine learning tool. The bit about the Atari is that I ported a trained model ("memory") from MARS (which runs on Windows) to the Atari. The point I was trying to make is that often, even older (!) hardware can support advanced programming techniques.

Bonjour,
je suis tr�s content d'avoir re�u tes r�ponses
j'ai r�pertori� ces bugs sur Draconis 1.6.3 :
- selon la r�solution graphique du Milan les images ne s'affichent pas ou
alors uniquement en mode optimis�.
- si sur certains sites la gestion de formulaire marche (www.altavista.com)
sur d'autres elle est vraiment calamiteuse
on a droit un joli bouton validez mais rien ne se passe qd on clique dessus
- qd on clique sur un champ de saisie d'un formulaire on a pas le temps de
saisir et il part avec un champ vide
- ds la gestion des ancrages HTML il suffit qu'on en est
plusieurs sur la ligne du style
abcd
et bien si on clique sur b,c ou d c'est comme si on avait cliqu� sur a
- des plantages qui courcicuitent meme le CTRL ALT DEL heureusement que l'on
a un bouton de RESET
- qd on a affaire a un URL de ce type tri.htm?chaine= il nous sort des
erreurs de syntaxe
A part cela je suis qd meme content de pouvoir consult� mes mails sur mon
ATARI !!
Une am�lioration qu'ils peuvent faire c'est qd ADAMAS trouve une erreur de
syntaxe
il faudrait pouvoir choisir entre de continuer a rester a executer cette
page ou rester
la ou on est
Cela serait super !
A +
Olivier

Where can I find a ROM dumper utility for an Atari 1040ST?

I have downloaded Gemulator and I also downloaded 2 versions of
the Atari ROM- 1.4 and 2.6 from
http://www.lgd.fatal-design.com/. All of which work fine with
some Atari programs but I'm having no luck with Megamax Laser C
which crashes my Pentium.

So, the author of Gemulator suggested getting a dumper utility
to download the ROM from my own 1040ST which still works.

I can understand why Laser C crashes your emulator. Compilers are
usually very designed very specifically for the architecture. Is there
some reason why you would want to run your Laser C programs under the
emulator?

If you know about C compilers I suppose you also know how to setup a
newsreader properly: Turn off the html rubbish!!! And while you are
busy with this, try learn how to quote properly.

Check your ST's TOS version. If it says 1985 it's 1.0, 1987 is 1.2 and
1989 is 1.4 and download the same version. Really no need for a dumper
utility as most TOS versions are available.

Start the emulator in "Atari disk mode" and set it up to boot from
floppy and in monochrome. Now put in your normal boot floppy from the
real ST. Keep any original floppies writeprotected as Win-95/98 also
writes to the floppy when reading (SIC!).

If this does not work then you are probably out of luck. Gemulator 2000
is generally very good but you may also try a more "games oriented"
emulator. Sorry, I don't remember any names.

Source record: 2125

---------- Forwarded message ----------
Date: Mon, 17 Jan 2000 14:32:54 +0100
From: Jo'ogn <juergen@tcpip-gmbh.de>
Newsgroups: comp.sys.atari.st
Subject: ? Settime, Tsetime, setftime & Pure C on ST ? (119 years)

as i don't have a realtime-clock on my 1040ST (2.06eng)
i've written a little c-prg that reads out the creation-date of itself,
shows it on the screen (e.g. at boot-up) and lets me inc/dec the
date according to the actual day and sets an updated creation-date by
means of "setftime()" (to remember it next boot-time) this all works fine !

now i send this date to "Tsettime()" to set the internal GEMDOS date.
but e.g. 14.1.2000 on the file gives me 14.1.80, or 14.1.28 in
the xcontrol.acc.

even setting the xcontrol to 14.1.00 did set back the year to 1980/2028
after exiting an application.

even using the XBIOS Settime (all from pure c 1.1) doesn't sove this.
i had a similar tool runnig before 2000 and it worked !
it cannot be a y2k as it's just an offset to 1980.

furthermore i wonder why Tsetdate has 7bits for the year, but the
(german) "Atari Profibuch" states that year can only be 119 max !
where are the other 9 are left.

regards

Hi!
First of all, you should email to the Draconis-Support instead using the maus.computer.atari.software forum for Draconis Bugreports.

1. when loading page the system crashes and the hit on CTRL+ALT+DEL becomes inoperant
a) Which web page? Please specify it as good as possible to make us able to reproduce the errors.
b) What happens on a System when a program crashes is not affectable by us.
Most crashes on Adamas are Bus-Errors, and if the Milan-TOS does not react of
CTRL+ALT+DEL anymore after this there is nothing we can do...
2. on the website www.yahoo.com the input text is affected to a link , when i click to modify it i
can't do it
and adamas starts an other page saying me that i make an error
The bug is known and currently under examination.
3. could you modify the error messages of syntax error , style internet explorer . if adamas is
finding errors
you will be able to ask you if we want to continue with this page and an option for desactiving of
the control
You will be able to deactivate the JS Error-messages in the new 1.7 version.
4. i am not sure that is on www.yahoo.com but i view a bug like this :
<A href="a">a
<A href="b">b
<A href="c">c
<A href="d">d/a>
if i click on b,c,d it is the same thing if i have clicked on a
We know one website where this error occurs too, but we are still searching for the reason.
5. if a site make time to answer , you could put on adamas a message who prevents us if we would
continue or stop the transfer.
The problem on version 1.6 and earlier is the blocking "GetHostbyname"-Call, so the System will not be able to do anything unless the funktion came back with the IP-adress or timeout.
i am waiting for your response ASAP
You have luck I read your posting anyway, if you want an answer for problems I strongly recommend to email to the Draconis-Support!

My Atari is getting long in the tooth. I suspect it may die any day. Also, I did a lot with Laser C before my Atari hard drive crashed and rather than buy another Atari hard drive- it seems sensible to do it all on a PC in emulator mode- until I can learn MS Visual C++, then convert the programs written on the Atari for my consulting business. The author of Gemulator swears it works. Whenever I write him a message telling him it doesn't, he bitches that I dare complain while telling me- insisting that it works. What an asshole. I hope he's reading this. <G>

Hi I am a demo coder adn musician on the PC scene, but I'd liek to give my old ST the treatment that it has lacked for a few years, does anyone know where I can get hold of a copy of c/c++ that allows inline asm code, and an assembler for the ST. I could also do with some tutes for 68000 asm coding.

Thanx

Hi,

I have two SLM804 printers gathering dust in a corner since I do not have any Atari system. I'd like to have any programming info available on those printers, especially the connector's pinout (I also have the SLMC804) because I want to use them on a PC. Maybe even write a Linux (or Ghostscript) driver for it.

Thanks.

Are you sure you can do this, I maybe wrong here, but didn't the SLM804 rely
on ASCI and ST RAM to work?

Precisely, so it cannot be done easily.

Welcome!

> can get hold of a copy of c/c++ that allows inline asm code, and an assembler
For C++ there is only GCC which uses its own (ugly) assembler syntax
and is deeead slow on a ST.
For C, SozobonX allows inline asm I think (not so sure):
http://ftp.lip6.fr/pub/atari/Programming/, then get soz*
Anyway you can always do object linking instead (not very practical I
agree)...

... but you should consider using only assembler, as there are some very
practical integrated ASM "environments":
- Turbo Assembler (the best for 68000, alas deutsche Doku):
http://ftp.lip6.fr/pub/atari/Programming/tuass177.lzh
- Assemble: http://wombat.ludvika.se/ae/dhs_files/misc/assemble.lzh
- Devpac 1: a bit old but still usable (current is 3.10, NOT freeware
:(...). But I dunno where to find it.

Others are commercial or too old to mention or unknown to me!

I think they were manufactured by QMS<?> and also made for other platforms.
I can't recall the exact model of QMS, but you should be able to find
drivers and support for them.

This cannot be done. The SLM printers don't connect to the parallel port,
but to Atari's proprietary ACSI port. They are designed to work with an
Atari only, since they use the ST's RAM. This was Atari's way of providing a
cheap laser printing solution.

There is a software solution that allows you to print to an SLM by using an
Atari ST as an interface. The ST must have at least 2Mb of RAM to run an SLM
printer.

In any case, it is probably not worth it. You'll be very lucky to find
cartridges for this printer, and the quality is not up to that of a modern
deskjet type printer.

It is not only a question of connecting wires but also of timing of
the signals. What outputs does your computer have?
I took a quick look in the SLM Atari manual: pixel data comes in
serial with clock and there are a lot of other signals (paper empty,
toner gone, printer not closed, not ready, heating up etc.) needing
to be reacted on (in time!).
I do not think that you will be happy trying to have your computer
listen en send those signals.
But find some die-hard Atarians to make happy with the printers!

I think the mechanism was for most of them TEC (Tokyo Electric
Company). But there were also Cannon drives in use for a while. With
different signals going in and a different interface with same
name/number but not-exchangable!

I once had problems with a Falcon-interface for this printer.
The german makers of it also did not know about this hidden fact. And
I had such a Canon SLM 804!

I guess you are using the free Gemulator 2000? If so I would not expect
any real support at all! And it is well known that Derek is not really
very polite :-) But his program is actually very good and free, so I
suppose he has the right to behave as he likes. And it's very likely
that your compiler is doing something illegal not (yet?) "covered" by
the emulator.

Actually I too had problems with Gemulator-98 freezing my pc so I had
to press the reset button. I did upgrade to the latest Directx drivers
7.0a (?) and the new Gemulator-2000 and since then it works OK.

Also the latest STinG (Atari tcp/ip kernel) no longer runs with
Gemulator. I think it's about the handling of serial in/out-put buffers
not behaving like on genuine Atari hardware.

The same goes for other [hardware] emulators like the Milan (aimed at
those who dislike discussions about emulators in the group!). Most old
programs works but some don't.

Hmmm ... this will be hard work! The SLM804 (a page-printer) is designed to use the ST RAM to prepare the page image prior to printing. So, you not only need to emulate the printer interface but also the DMA (store-access) interface. Good luck!

Dont use c code for demos on st.. theres no reason for it.. its slooow and
not useful for demos..

get devpac 3.10 or so.. and take a look at latest ucm discmaggie (#18) for
info about 68000 coding..

all info and files (apart from devpac) are available on dhs site..

The bad news is that you won't be able to use these printers on a PC, at
least not directly.

Atari's way of printing to their laser printers involved building the page
image *in the Atari's memmory* and sending that as data to the printer.

This means that you *must* have an Atari (1-2Mb) to use one of these (or
the 605) printer. Assuming that you can get one, then you can use a utility
prog that's available on my web site (follow the translated apps link) that
will let you print from any other computer to the SLM through the Atari,
using that computer's HP printer driver set to print to serial port or disk
file. I have to say that you would be better off buying a standard printer.

The SLM804 uses TEC LB-1301 drums.

I' like to connect the SLM to an PC, too. But I dont't do it,, because I own
an ST with a PAK accelerator.

I think the easiest way to use a SLM804 Laser with SLMC804 Controller is to
buy an old Mega ST with 4 MB and maybe a SM124 monitor (if you don't use an
TV set) and a small harddisk.. It should cost less than a new laser printer.

On this computer you have to install an Diablo SLM emulator (archives similar
to diab630 or SLM1_4) at
http://www.muenster.de/~reschke/
to use the laser like a printer connected to the centronics parallel port.
You may install GEM Ghostscript gemgs from
http://www.tu-harburg.de/~smcf1605/ (actually moving). The SLM-Driver of
gemgs uses the emulator for outpout onto the ACSI-Port.
On linux you have to install lpr (I think) and SLMtool s from the linux-m68k
archive tree. Ghostscript is newer in Debian Linux Distribution than in the
m68k archive.

we are pleased to report that the very rare,and elusive 7800/2600 monitor carts are in stock now,if you were on the reserve list,you should have received a e-mail from us stating this fact,with ordering information,if you did not receive a e-mail,please contact us a.s.a.p.,for this is a limited time offer,and qauntities are very limited.
if you are interested in one of these actual licensed atari product for your collection,or use,please contact us now,we may have a few left,but time is of the essence.
the list price on this item is $99.95,this is a low end development system for your 7800,it will allow you to develop your own 2600 game,and store it in a 8k battery backed up ram,or 16k battery backed up ram for the 7800,it is cartridge based,using the 2 joystick ports of your 7800,and the 2600 keypads/touch pads,or sesame st. controllers for data input devices.
this cart development system also comes with a 200 page developers manual,and schematics of the7800,also it has 3 2600 games on board,also with a demo of a unreleased 7800 game on board. ordering information can be found on our web site at, www.atarisales.com
thanks,
lance

3835. Reading kbd clock in GFA

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-25 00:00:00 UTC
From: kennethm@tripnet.se
Message-ID: <388ce27625a9280@tripnet.se>
Source record: 2154

I'm trying to read the 6 bytes time/date from the keyboard processor
with some GFA code I got from somewhere, but all I get is 6 zeros.

The idea is to let the clockvec from xbios 34 (Kbdvbase) point to the
short code in machine_code$ to get the address where the 6 bytes will
be stored, copy them to a safe place (in data%(2)) and restore the
original clockvector.

This routine assumes that the pointer arrives in A0 but my old "Atari
ST Internals" says D0 (move.l d0,*A%) wich does not work either.

Any better solutions or comments?

```
DIM data%(2) ! 12 bytes, plenty of space for the clock.
LET data%=VARPTR(data%(0)) ! Address of it.

Here is the code:
'
address%=0 ! Place to store the address of the clock packet.
machine_code$=MKI$(&H23C8)+MKL$(*address%)+MKI$(&H4E75) ! move.l a0,*A% rts
vector%=XBIOS(34)+20 ! Old clockvec location
old_vector%=LPEEK(vector%) ! Old clockvec value
LPOKE vector%,VARPTR(machine_code$) ! New clock value
address%=0 ! Clear value (just to be sure).
OUT 4,&H1C ! Request a clock value
REPEAT ! Wait for Interrupt
UNTIL address% ! (Until an address is present in A%
BMOVE address%,data%,6 ! Move it before it gets overwritten
LPOKE vector%,old_vector% ! Restore old vector
'
CLS
FOR i%=data% TO data%+5
PRINT ASC(CHAR{i%})
NEXT i%
```

3836. Patched ROM dump from memory

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-25 00:00:00 UTC
From: Mike <magicmac@my-deja.com>
Message-ID: <86lbsi$68s$1@nnrp1.deja.com>
Source record: 2155

How can a copy of a patched ROM that has been transfered to TT ram (Ala Afterburner Tool Kit) be saved to a file? I'm pretty ignorant when it comes to addresses and such, so please walk me through saving the ROM image, and what to tell the Electronics guy who is going to burn a new ROM for me what to do with it.

I noticed the ROM for the Falcon has 4mb capacity, but TOS only occupies a small portion. Other than having them available at boot up, would there be any benifit to having other applications placed on ROM and accessable through a CPX or something when booting off a floppy? HS Modem? JPGDSP?

TIA,
Mike

I too have a 1040STe + TOS 2.06 and am having trouble with TSETTIME.
It seems to boot up with date in hex of '6000' (0/0/2028), and I wrote
a small assembler prog. to set it to '2839' for example (25/1/2000),
but then TGETDATE returns '6039' instead (25/1/2028). Very strange.
I thought these things were supposed to be year 2000 compliant?
Gary.

Without a patch to the XBIOS the clock on all Atari machines without a
built in RTC isn't y2k compliant.

Philip Taylor wrote a detailed description about this last March in
article Message-ID: <7cirnskps1@plug.news.pipex.net>. If you can
persuade deja.com to display it, it describes the reason for the failure
quite well. Another useful site, and one where you can (possibly) get
the required patches is John Whalleys page at

> http://www.whalley.demon.co.uk/atari/y2k.html
thx a lot, perhaps there's a chance:
quoting from http://www.whalley.demon.co.uk/atari/y2k.txt

- start -
The XBIOS problem is such that dates after 1999 will not be handled correctly
by the following XBIOS functions:

Trap#14 - Function #$16 Set 32-bit DOS format date & time.
Trap#14 - Function #$17 Get 32-bit DOS format date & time.

For years from 2000 to 2059, the consequence is that the date part of the
SetDate&Time function is ignored and the GetDate&Time date part return
value remains unchanged from when it was last successfully set.

For years from 2060 to 2107, the GetDate&Time date part return
values are from 2028 to 2075 respectively.

The good news is that the GEMDOS Trap #2 - Date and Time functions
work correctly.
The bad news is that a lot of programs use the XBIOS functions and those
programs that do so will need a patch.
- end -

i'll give it a try by using the gemdos directly.

K > Does anyone have any information about the .PRG file format on
K > the ST/STE ?

Yes.

There's a 28 byte header (drihdr) which includes a magic number
($601A), the sizes of the remaining segments and the program flags
(FASTLOAD etc). It's followed by the text and data segments, the
symbol table (not used), fixup table (converts all absolute
addresses) and (optionally) debug data (also not used).

3853. Re: Atari ST prg file format

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-28 00:00:00 UTC
From: David Bolt <dbolt@my-ste.demon.co.uk>
Message-ID: <N0m+RXA+sik4EwbT@my-ste.demon.co.uk>
Source record: 2172

>Does anyone have any information about the .PRG file format on the ST/STE ?

Here's the (limited) info I have about it.

Offset Size Contents
(hex)

000000 2 0x601A (bra.s *+0x1A) jump to start of text segment.
000002 4 length of the text segment (program code)
000006 4 length of the initialised data segment
00000a 4 length of the uninitialised data segment
00000e 4 length of the (debug) symbol table
000012 4 reserved
000016 4 reserved
00001a 2 reserved
00001c ? start of text segment

The format of the symbol table is as follows:

Offset Size Contents
(hex) (bytes)

00 8 Symbol name, upto 8 chars, null (0x00) terminated if
less than 8 chars
08 2 Symbol type
0a 4 Symbol value

Normally programs are compiled/assembled as relocatable code and,
therefore have all offsets relative to 0x000000. The relocation table is
a byte array used to convert these offsets to the correct addresses,
with the first 4 bytes representing the offset to the first absolute
address. Each byte represents the number of bytes to the next absolute
address. Some values have special meanings and these are as follows:

0x00 flags end of the table
0x01 add 254 bytes to the pointer and read next byte in relocation
table.

Note. Odd address offsets, i.e. 0x03, 0x05, etc. are illegal and are
likely to show the table has been corrupted.

3856. RADWAR PARTY 'Demo Competition' in May 2000

Newsgroup: comp.sys.atari.programmer
Date: 2000-01-29 00:00:00 UTC
From: RADWAR <mws@radwar.com>
Message-ID: <86tvhrqde3@news04.btx.dtag.de>
Source record: 2175

RADWAR PARTY 'Demo Competition' in May 2000
1st price: 3000 German Marks (1500 Euro)
2nd price 2000 German Marks (1000 Euro)
3rd price 1000 German Marks (500 Euro)

read on ...

Dear Demo-Coders,

we would like to setup a demo competition at the RADWAR Party 2000.

But we would not like to organice a simple, normal and usual competition.
You have already seen them a thousand times, therefore we invented somewhat
special.

You ask why, ok here are the answers

1. We do not have the time on the party to organice for each computersystem
a separate competition.
The party would be interrupted too much, because mainly we want to celebrate
and booze.
You can watch a computer monitor at home for the wholy rest of your life.

2. Normally everyone wants to program the demo with the best effects. In
addition always 3D Routines, grafix and music can be seen. However it's very
hard to compare one demo with another. Each individual program has evenly
its special characteristics.Therefore we have decided to give you a certain
topic. This has to be coded by the programmers on the machine, where they
have the best knowledge on. Hereby we want to achieve, that also a DEMO on a
Commodore C-64 with many ideas and humor, in the overall view ,can be better
than a DEMO on a 700 MHz strong Pentium machine with 32Meg of VGA memory and
a Sounblaster Live experience.

Rules:
In order to deal with the problems of technique, the DEMOS should be
recorded on a VHS video tape. On the party the DEMOS are then shown on large
video monitors and also viewed to the wall by a video beamer. Therefore the
demos should be send to us until at least one week before the party. A video
tape with your one recording of it would be best. A CDROM or a diskette must
be attached as proof of programming.

As a topic or storyboard for the demo we did not commit ourselves yet.
However we already made some thoughts, which we want to indicate to you
gladly.

For example: ' Little party People ' following the very successful game '
Little computer People ' from Activision. The game was developed for

Commodore C64 and Commodore AMIGA. We thought of a kind of conversion of the party atmosphere in a Comic style. You see the party space in several levels and you can watch the partyfreaks doing their activities.

Szenario Ideas:
Drunken Freaks are fighting the security, dancing Cracker in leathertrousers, naked girls on stage, GoGo dancers with their LiveAct or the big eating at the food buffet.

These are naturally only a few ideas, you should free your on phantasy for the storyboard of your demo.
If the whole thing will then provide good acoustic output and speech blisters as in a Comic, then the evaluation of the demos will surely be more interesting.
All guests at the party will watch the show for sure, even the real AMIGA and C-64 fans, that would normally not look at a PC Demo, cauze they hate PCs.

And as a matter of fact, there will be good prices to win

1st price: 3000 German Marks
2nd price 2000 German Marks
3rd price 1000 German Marks

And all the others will get special prices like software and hardware, no one will loose thiz way.

What do you think abou thiz ...

We are awaiting your feedback very soon, cauze the time is already running ... party time is coming
closer and closer.

Thank you for your attention,

MWS of RADWAR

Hello everyone!

Well, I'm a beginner. I bought Pure Pascal 1.1.1. I bought a book "Turbo Pascal 7.0. The compendium" (German, Markt & Technik, 1993) because I read that they are compatible.
Let me tell you that I'm not posting this lightheartedly. I've been trying to solve this on my own for two weeks, thinking I've overseen something very smallish and simple somewhere.
What is the reason why THIS doesn't work in Pure Pascal:

```
PROGRAM readinttest;
uses crt;
var i : longint;
n : word;

PROCEDURE readint(var zahl: longint; anzahl: byte);
var eingabe, puff : string;
cf : text;
savex,savey : byte;
contr : integer;

begin
if anzahl>11 then anzahl:=11;
assigncrt(cf);
settextbuf(cf,puff,anzahl+2);
reset(cf);
savex:=wherex;savey:=wherey;
repeat
gotoxy(savex,savey);
clreol;
readln(cf,eingabe);
if savey=lo(windmax)+1then dec(savey);
val(eingabe,zahl,contr);
until contr=0;
close(cf);
gotoxy(savex+length(eingabe),savey);
end;

BEGIN
n:=1;
repeat
readint(i,n);writeln(' **** ',i);
inc(n,2);
until n>12;
write(^j,'<ENTER>'); readln;
end.
```

I'm sorry for this long posting. But this problem stops me completely.
Please forgive the "german-ish" names for variables.

And Thanx in advance.

Hello,

I was checking through some old boxes and I discovered two
items left over from when I owned an Atari 130XE. One is a nealrly new
condition Radio Shack joystick, with autofire. I remember buying it
for $14.99 but I'll let it go for $4.99 plus shipping USPS.

I also discovered a 1983 mint condition "Hackerbook for your Atari
Computer" by H.C. Wagner that was written for the Atari 400/800 and
mentions how to make a bootable cartridge and how to create an Atari
Eprom burner from game ports 1, 2, and 3. It also mentions how to
create a serial port or a parallel port from game ports 3 and 4. It
includes the source code listings in the text. I think it cost $7.95
new, so I'll let it go for $2.99 plush shipping USPS.

Let me know if you want one or both items.

I seem to be having some trouble connecting to my Internet Service Provider (ISP) lately using PPPKIT with MINTNET and PPP.I tried using Connect and get a message about invalid logon.(I made sure I entered My UserId and Password correctly).When I use Sting I have no problem connecting (and when I tried going through Compuserve using PPPKIT I had no trouble.)

I'm guessing because Sting uses PAP I should try to set up PPPKIT to make a PAP connection.

Can someone show me how I go about setting up a PAP connection using PPPkit?
Thank You
Mike

1. Create a file /etc/ppp/pap-secrets. This should contain the usernames
and passwords for all your PAP-accounts, one account on each line:

username * password

2. chmod 600 /etc/ppp/pap-secrets
If you don't have /etc on a minix- or ext2-filesystem you can't do this...

3. Add a 'user username' in the options-file (replace 'username' with your
PAP-username).

4. ...and make sure that your login-script is correct. You usually don't
need anything after CONNECT when you're using PAP or CHAP.

>You've forgotten to say what the problem was?
Sorry!
The procedure (it's supposed to be an include-file) is meant to control whether the input from the user is in integer format and
force him to reenter his input if it's not.
The program itself only tests the procedure in that it returns
whatever input the user has given with "****" in front. The procedure
is there to only let through variables of the sort integer.
Whenever I run this little program, I can input one number. Second
time around, I get a RAM violation and a strange error-code, the program
crashes and won't let me try again.
There is a list of incompatible instructions at the end of the PP
manual, but I haven't found anything in there.
Is it the "reset(cf)"? I find that reset seems to mean very different
things in TP and PP.
Hope I haven't forgotten any CR/LFs

On mu TOS 3.01 TT none of these problems show up! Both gemdos and xbios
time can be correctly set and read up to 2107!

Only when letting the computer roll over from 28/2-2100 to 1/3-2100
there was a small glitch. Right afterwards gemdos gave 29/2 but xbios
gave the correct 1/3. After opening and closing the Control panel they
were both on 1/3. Interesting. Actually it looks like someone has put
in the 400 year rule into TOS!. Year 2100 is not a leap year according
to this rule. I guess some of the TOS programmers hoped for TOS beeing
in use up to the 2200 century.

The keyboard processor clock is a totally different story, though.
Maybe they hoped for a newer TOS add on that you can talk with :-) If
so it really should be out by now.

>The good news is that the GEMDOS Trap #2 - Date and Time functions
>work correctly.

True!

>The bad news is that a lot of programs use the XBIOS functions and
those
>programs that do so will need a patch.

Not true here!

I did these tests with a small GFA program to be able ta set any year.

> Hope I haven't forgotten any CR/LFs

Here's two extracts from my Prospero Pascal manual - it was pretty
conforming back then. The info may be useful...

<start>
8.3.1.2 reset and rewrite

The procedure reset(gf) prepares gf for input. If the file is empty,
eof(gf) becomes true, otherwise eof(gf) becomes false and the buffer
variable gf^ is positioned to the first element of the file.

The procedure rewrite(gf) prepares gf for output. The buffer variable
gf^ is positioned to the first element, and eof(gf) becomes true. Any
previous contents of the file are lost.

In general, any file must be initialised before input or output
operations can be performed. Exceptions are the standard files,
"input" and "output" for which initialising is done before the Pascal
program is entered.

8.4.2.1.5
PROCEDURE reset(VAR f:FILE)
PROCEDURE rewrite(VAR f:FILE)

These procedures are part of Standard Pascal, and have already been
defined in section 8.3.1 in relation to workfiles. They are also
applicable when an external filename has been assigned and the file is
to be processed sequentially. "Reset" prepares the file variable for
input (read) and "Rewrite" for output (write) operations. Calling

reset or rewrite causes the operating system "open file" process to
take place.

Example:

```
assign(f,'B:SUBDIR\NAME.EXT');
rewrite(f);
writeln(f,'First line of text');
```

When reset is called the external file must exist (but may be empty,
in which case eof(f) is immediately true). If reset is called with a
parameter which is an already-open file, it is repositioned at its
first element. When rewrite is called, if the external file already
exists its contents are deleted, and if it does not a new empty file
is created.
</start>

Possible concerns imo would be that "settextbuf" and how "reset" acts
upon it. Perhaps the file variable cf has remained at "eof" after the
first input - if so, it might just be the case that a second input
attempt is shoving text in "past eof" (ie leaking into memory after
'puff'), thereby crashing your program.

Maybe "reset" out to be within your repeat/until loop?

I think it's because you have defined "n" as a word (2 bytes) and
then told the procedure to read it (anzahl) as a single byte, which
would be the first of the two-byte binary number, ie: zero every
time. Try defining n as byte as well?
Gary.

argv[0] traditionally is reserved for the program name. Unfortunately
the format of said program name can & does vary. It might be the
entire path plus executable name, it might be the executable name or
it might only consist of the "stem" - executable name minus executable
extender (ie .PRG or similar removed).

Just to make life simple (not!), a bog standard Atari won't get
anything from Gem: argv[0] is empty. Thus, the only time you'll get
something is if another program passed the name, such as a command
shell.

>I know Fsfirst can be used if one know the prefix of the name and the
>directory to search to, but is there is another way that also works when
>the program is launched from within another (unknown) directory?

You know what kind of program you are. This may make the situation
less vague as it may narrow down the environment. However, this kind
of approach can help...

Look at argv[0]

Full path? fine.

Exename only? Interrogate system for exe's folder - "dos" is almost
always the current working directory (cwd) so
FsFirst/Next(".\\progname.*") will locate it. Should your program be
capable of running when its folder isn't the cwd then it invariably
turns out to be a unix kind of thing where you'll be using an
environmental variable - problem can be bypassed via that.

Gem. Although it is possible to start a Gem program with the cwd !=
the executable things usually go wrong (consider
rsrc_load("progname.rsc")). You can enquire of the AES (I forget which
call offhand) and see what that comes up with: the older the Gem the
less useful this info is. However, due to the fact cwd has to be set
to the executable then FsFirst/Next will work here - even under OS's
such as MagiC, which maintain multiple cwd's, one per app. Again,
should your program be designed to cope with cwd != executable then
we're back to the unix situation again.

Nothing in argv[0]? FsFirst(".*.app") - will locate your program's
name. You might consider looking for a combination of extenders - I
often change them (.PRG -> .GTP for example) iyswim.

>Please do not tell me to use a particular startup lib, I would precisely
>like to know how it works...

Here's the 64,000 dollar question though...

Just how often does a program get written that *really* needs to know
its own name? ;-))

Imo, the less a program has to do with the underlying filing system,
the better its chances are of working!

also you may want to check out
http://www.cix.co.uk/~derryck/

here is the text that Derryck includes:
"MagicSLM (German docs) A software solution to the problem of printing
from a Falcon/PC/Mac or whatever to Atari's SLM804/605 laser printers
using an HP Deskjet or Laserjet 300dpi driver on the client computer.
You will need the ST (minimum 2Mb memory), the Diablo emulator
(available on ftp sites), and a null modem cable to connect the two. Use
the highest common baud rate, 8-N-1 with no handshake on the ST, same
settings but XOn/XOff on the client computer, or if you can't redirect
printer output to the printer port you may be able to print to a disk
file and take that to the ST (full package).

3878. Anyone here with GNU C/C++?

Newsgroup: comp.sys.atari.programmer
Date: 2000-02-08 00:00:00 UTC
From: Nenad <nenad@baxter.net>
Message-ID: <87pv2a$2h8$1@nnrp1.deja.com>
Source record: 2197

Hi everybody,

I tried posting a message similar to this one in the general atari st forum, and I am hoping to find some more people in this forum with the same problem, or better yet with the solution :))

Where do you find GNU C/C++ distribution that works reliably enough and that has all the necessary libraries/includes not just some?

I am trying to install one version of GCC that would work reliably enough, and didn't have much luck so far. Sometimes it's the libraries or includes, sometimes binaries... It also seems there's no one individual FTP site where you can download the full distribution from, but it's all bits and pieces that you have to collect from many different places. If nothing else, I wish somebody would post some installation notes on how to get a complete and reliable version of GCC.

Here are some annoying bugs that I found in the available releases:

If you have 2.8.1c or 2.7.3 try this and you'll confuse the pre-processor:

```
#include <stdio.h>
#include "whatever.h"
/* use some things (typedefs, prototypes...) from whatever.h */
```

If you put #include <stdio.h> in "whatever.h" it will be ok. What's even funnier, if you put the second line before the first one, it will work (provided you don't use anything from stdio.h in whatever.h)

Another #include bug:

for example, make these files:

```
./main.c
./include/main.h
./include/structs/struct1.h
```

1. from main.c #include "include/main.h"
2. from main.h #include "structs/struct1.h"

Step 2 won't work... :(((

One of the worst bugs for me, when using the getc() function from <stdio.h>, the compiler complains about its defintion!!! I think what we have is an obsolete version of <stdio.h> header.

If somebody knows something more about any of these problems, please let me know, I'd appreciate it. I am hoping it's just me, otherwise it

would be relly sad us atarians are left with only one dev.
environement, that's not even reliable enough to work with.

Regards,

Nenad

If it's only two bytes you could

LSL.L #8,D0
LSR.W #8,D0
MOVE.L D0,<ea> ;odd bytes

or
ROR.L #8,D0
LSL.W #8,D0
MOVE.L D0,<ea> ;even bytes

but frankly, movep is better.

I think I got it from the latest 'Whiteline' CD. In addition there was
an article in the german STC where IIRC something stood about renaming
some library files. I think after that 2.8.1 worked fine for me.
Since I destroyed my minix partition a few days ago I will have to
install everything again in the near future. So if your problems are
not solved until then, I can tell you step by step what I did,
afterwards.

The only thing I use GCC for is compiling the Atari800 emulator source
but I never had any problems with 'include' there, neither with 2.7,

nor with 2.8. The only problem I had (and never were able to solve)
was that I couldn't find any way to use 'make' and had to write seperate
commands for every module to be compiled.

Gerhard

The original reason for Motorola to make this instruction is
"This instruction is intended to simplify data transfers between the
processor and 8-bit devices"
So we can do without it. But it gets more complicated to do.
No only have you to take care of odd/even in source and target
aderssses but also do it different when the MoveP does long or word
operation size! And also remember:
"As each byte of data is transferred (long word operand), the adres
is incremented by 2. Note that the contents of the address register
itself are not incremented."

>
>What is an alternate way to do a "movep"?

You could try these as an alternative. All of the subroutines use d0 as
the data register and a0 as the address register. A0 is preserved in all
of these subroutines.

; movep.w register -> memory/peripheral
moverp_w link #0,a6
move.l a0,(a6)
ror #8,d0
move.b d0,(a0)
addq.l #2,a0
ror #8,d0
move.b d0,(a0)
move.l (a6),a0
unlk a6
rts

; movep.l register -> memory/peripheral
moverp_l link #0,a6
move.l a0,(a6)
ror.l #8,d0
move.b d0,(a0)
addq.l #2,a0
ror.l #8,d0
move.b d0,(a0)
addq.l #2,a0
ror.l #8,d0
move.b d0,(a0)
addq.l #2,a0
ror.l #8,d0
move.b d0,(a0)
move.l (a6),a0
unlk a6
rts
```

```
; movep.w memory/peripheral -> register
movepr_w link #0,a6
move.l a0,(a6)
move.b (a0),d0
ror #8,d0
addq.l #2,a0
move.b (a0),d0
ror #8,d0
move.l (a6),a0
unlk a6
rts

; movep.l memory/peripheral -> register
movepr_l link #0,a6
move.l a0,(a6)
move.b (a0),d0
ror.l #8,d0
addq.l #2,a0
move.b (a0),d0
ror.l #8,d0
addq.l #2,a0
move.b (a0),d0
ror.l #8,d0
addq.l #2,a0
move.b (a0),d0
ror.l #8,d0
move.l (a6),a0
unlk a6
rts
```

Not very efficient, and they take up some space, but they should work as good as the real movep.

When you write a header file you must take steps so that multiple includes
of the header file
does not cause problems, as the header file is only required to be parsed
once during the
compilation process.
For example if i wish to create the header file ingtcp.h I would use the
following construction:-

```
#ifndef _INGTCP_H
#define _INGTCP_H
/* the above two lines ensure that the first time the header is parsed the
definitions
will be stored for use by the compiler, but is ignored if parsed
subsequently */

/*- Global constants and other stuff in the file
-------------------------------*/
#pragma ident "@(#)$Id: ingtcp.h,v 1.5 2000/01/14 10:45:44 dba Exp $"

#include <stdio.h>

#define ING_OK 0 /* All subroutines return this value if OK */
#define BAD -1
#define YES 1
#define NO 0

#endif /* _INGTCP_H HEADER INCLUDED */
/*---above line is the last in the file ingtcp.h and matches the #ifndef
_INGTCP_H ---*/
```

examine the stdio.h file and you should see the above construction in the
file

regards

Yup, now the GEM++ library is the problem :)

It compiles pretty well, but the linking is the problem again. I have tried to compile on my own a small example called ACCes, that I found on this page:
http://www.qnx.com/~chrish/Atari/GEM/index.html

When I try to link the modules of this program I get many "Undefined symbol ... " messages. Here's what they say:

```
Undefined symbol GEMformwindow::GEMform virtual table referenced from
text
Undefined symbol _InFocus__13GEMformwindowb referenced from text
Undefined symbol GEMformwindow::~GEMformwindow() referenced from text
Undefined symbol ___ti13GEMformwindow referenced from text
Undefined symbol ___tf7GEMmenu referenced from text
Undefined symbol ___ti7GEMmenu referenced from text
gemw.o: Undefined symbol __intin referenced from text
gemw.o: Undefined symbol __intin referenced from text
gemw.o: Undefined symbol __intin referenced from text
gemw.o: Undefined symbol ___aes__ referenced from text
gemw.o: Undefined symbol __intout referenced from text
gemw.o: Undefined symbol __intout referenced from text
```

Does anybody know what I might be doing wrong (again) :)

Cheers,

;-)

>Fair enough, but seriously, what does that achieve??.
C'mon tell us. I've become curious as well now.
I figure you probably forgot you did have something on the clipboard and
then overwrote it with a second "copy"?
OTOH you should push the abolishment of the 'cut' feature. Because then it's really lost!

From: mgrove@iwvisp.com (Mikey)
Organization:
Subject: Disassembly
X-Newsreader: NEWSie Version 0.94 (Atari)

I've been playing around with TOS 4.04 and noticed that images loaded into Hex Edit,TT Digger and BSS Debug sometimes don't quite jive with one another. I trust BSS Debug as the image files look like what I see in memory. Desert Drain seems cool, but V1.57 is really buggy on my Falcon, not being able to download the whole ROM area in memory and the editor doesn't pop up into a window, just a white screen. V1.52 works fair. Would be nice if TT Digger could save a binary file like Hex Edit, otherwise, that app is a lot of fun.
Peace Debug is a bit over my head, and like using BSS Debug, but it doesn't use GEM, so I have to disable my NOVA. Egad I forgot what 640*480 looked like:).
What is the best way to get a copy of the image? How do I read the first 8 bytes of ROM into a file? Manual says I have to be in Super mode. What is the beginning address to burn code into 2 ROMs for the cartridge port?

TIA,
Mike

Source record: 2212

To answer one of my own questions, there is no offset (at least with the diagnostic ROM booting from TOS ROM) necessary. The cartridge I have doesn't work with 27C256 ROMs (32K) so you need either the 512's (64K), 1024's (128K). Found a 44 PLCC to DIP adapter in Digikey for $24.00 to adapt the Falcon TOS ROM to the available EPROM burner here.
Following the TOS ROM at boot up is a chore, but I guess I am not the only one who has ever done this:) If you really want to know about your hardware, but just didn't get it the first time reading documentation, get a debugger and follow step by step with manual in hand. This is all new to me, and it sure opens your eyes up to what is going on when you click an application, or turn on the juice.
There is a guy with a bus analizer sitting outside the door tied into an SGI, and I have been looking over his sholder. Sure looks like it makes the job much easier.

3894. Magic and Lattice C

Newsgroup: comp.sys.atari.programmer
Date: 2000-02-16 00:00:00 UTC
From: Dave Parsons <parsonsd@wam.umd.edu>
Message-ID: <Pine.GSO.4.21.0002161204030.28692-100000@sun02epsl.wam.umd.edu>
Source record: 2213

I am trying to get magic (v5... I think) to allow me to use LatticeC (v5.6). Now, I can *use* LatticeC, even compile, but if I made any mistakes, causing lattice to tell me I'm getting compilation errors, magic gets really upset and crashes catastrophically ("system halted").

Anybody else have similar problems with crossing magic and lattice? I haven't bothered to try LC.ttp to compile without using the menu-set options (not sure how to do that, anyway), but I do know that it has nothing to do with any accessories I use. Must I go back to swapping between everest and latticeC under TOS, put up with the lattice editor, or is magic6 any nicer?

... every day a new instrument and a new method is invented.
-- Theodoric (1267 AD)
----parsonsd@wam.umd.edu---http://www.wam.umd.edu/~parsonsd-----

PS: is anybody in America sponsoring everest? I never did quite figure out how to not use US (International?) money orders, nor personal checks with InterActive to get it registered.... now I cannot even send money to them!

3895. check the manuals

It seems I am still out from nodelist, Peter can you check my connected areas
?

BTW the question is this: Applylst does not work as it seems to be affected
by the y2k bug, so it deletes my nodediffs as it recognizes them as "obsolete
difference file".

It it possible to get the Applylst sources or is there another software that
can do this ? Breakneck ?

3897. == new NG about Atari OS evolution ? ==

Newsgroup: comp.sys.atari.programmer
Date: 2000-02-28 00:00:00 UTC
From: Gaetan Lehmann <glehmann@netcourrier.com>
Message-ID: <89e9br$34l$1@news.x-echo.com>
Source record: 2216

Hi :)

I would like to create an international newsgroup (english language) bas
ed
only around discussions and thoughts about our Operating System evolutio
n.
The purpose is to establish some specifications about new calls,
AES object structures or other. Any thoughts about functions, interface

possibility, function implementation will be welcome in this future
newsgroup. To participate in this newsgroup, no need to be a programer.
.
Just by telling what you would like to see on your Atari, or what you li
ke
about other OS will be considered helpful. I want to create this newsgro
up
about Atari OS because I think that no specific goal, no near future
vision is what stops our OS to move forward. If you wish to see such a
newsgroup, email me, I will take care of everything to implement it.

3898. Pexec and problems

Newsgroup: comp.sys.atari.programmer
Date: 2000-03-01 00:00:00 UTC
From: Olivier landemarre <olivier.landemarre@utbm.fr>
Message-ID: <38BCC442.515CCBBA@utbm.fr>
Source record: 2217

Hello

I'm doing a GEM Shell for GCC (2.8.1), but I have a big problem under
normal TOS (Magic and Mint Ok)
when I launch GCC.TTP with Pexec all looks Ok, this program launch
himself CPP.TTP the preprocessor.
This program work for a time and compilation failed, he looks not find
its Include Directory (I think). All parameters
are Ok, does someone have an idea?

Thanks
Olivier

Hi all,

Got a problem with BubbleGEM I just cannot sort out. Under MagiC it seems like the BubbleGEM helptext will sometimes show up in the title of any of the opened windows belonging to my program.

I believe I both have reserved memory for both the window title text and for the bubbleGEM message text. What could be wrong here??

Please help!

If you are using gfa-basic and I'm assuming you are, you
have to be very careful how you allocate such buffers.
Some types of variables, like strings get shifted around
in memory and if you use strings as buffer, strange errors
can appear.

Yes, I am using GFA. :) (what else?) ;)
Well I am using some sources from Ictari for handling the
BubbleGEM-stuff

Bubblebuffer is used like this;

bubblebuf%=MALLOC(256)
CHAR{bubblebuf%}=LEFT$(bubbletext$,255)

Memory for window title and info bar is reserved like this:

adr_title%(window_number&)=MALLOC(128)
adr_info%(window_number&)=MALLOC(128)

Is there a problem somehow with this code?

Another thing, how would a compiled program react if not enough memory
was reserved via $M ? Crash? Funny stuff like above mentioned? How will
I know exactly how much memory to reserve with $M above filesize?

Thanks,

Joakim

From: Nenad <nenad@baxter.net>
Message-ID: <8a0irk$rl8$1@nnrp1.deja.com>
Source record: 2225

Hi,

I am helping a friend port his program to Atari. The problem is about transfering the memory that stores the 24-bit data to the screen. The format we need to use is 3 bytes for each pixel (RGB), one pixel after another. It seems that VDI (MFDB) doesn't support the graphics organized in this manner. Is there a way around this - without reorganizing the bits. Any help is greatly appreciated.

Thanks,

Nenad

3907. [AES] Menu bar and top application

Newsgroup: comp.sys.atari.programmer
Date: 2000-03-06 00:00:00 UTC
From: Joakim H&#65533;gberg <gokmase@my-deja.com>
Message-ID: <8a0momuoj1@nnrp1.deja.com>
Source record: 2226

Hi all,

Discovered a strange thing when testing a program I am working on;

When topping any window (after having another top app, then my prog) by clicking on the windows title bar everything seems normal. Menu changes to my program and works ok.

Ok, but if I click inside the work area of my window then I will get strange results even though it is handled exactly the same way internally. MagiC will now change to my programs menu, but the earlier apps entries will be the one that shows if I go up and try to access it. And it will not work until I select a new top app.

What am I doing wrong here? Hope it is nothing really, really stupid... ;)

Regards,

Joakim

There's no converting routine in the VDI, no. You will have to do that
yourself, or perhaps if there is some lib that I don't know of.

As far as I know numeric arrays don't move. I never use ERASE
just to be safe. It looks ok to me what you have listed.

> Another thing, how would a compiled program react if not enough memory
> was reserved via $M ? Crash? Funny stuff like above mentioned? How will
> I know exactly how much memory to reserve with $M above filesize?

I think they halt with an ERROR 8.
That is a good question, and it seems to be best guess. All I can tell
you is to add up all your arrays, all your strings and such to get
a value, and then add some to that for a safe zone, just in case.
How much extra to add is the guess work part. Sorry I don't have
better answer here.

The physical memory in the 24-bit card may be stored several ways
so unless you know the format for a given card, it may be a problem.

The only other thing I can think of would be to convert the
image to vdi device independant format and have the VDI on the
machine transform the image for you to device specific.

I am not sure whether this helps, but I had problems with bubble help coming up as soon as I moved the mouse over the relevant field, or left-clicking (rather than right, which should bring up the bubbles). I solved this by making sure that Thomas Much's BUBGEM_E.CPX was active and set to 2000 ms for open. Just my 2 cents worth....

Ok, so it seems safe to assume that as long as the program do not halt due to ERROR 8, it really has enough memory to play with. I will go with that.

Thanks for all help! :)

It should be totally independent of the hardware.

> The only other thing I can think of would be to convert the
> image to vdi device independant format and have the VDI on the
> machine transform the image for you to device specific.

That's exactly what I am trying to avoid. This would mean that I would
have to write special routines for converting my memory to bit-planes
one, which is out of the question (cross-platform issues).

However, look everyone what I found in NVDI 5 documentation (you can
download it from www.nvdi.de). It seems that NVDI 5 modernized this
situation and it really answers my question. This is the new function:

vr_transfer_bits( int16 handle,
GCBITMAP *src_bm,
GCBITMAP *dst_bm,
RECT16 *src_rect,
RECT16 *dst_rect,
int16 mode );

and this is the GCBITMAP structure which looks like a modernized
version of MFDB (there's no mention of Atari's old-fashioned bit-
planes):

typedef struct _gcbitmap /* ffentliche Bitmapbeschreibung (Struktur
mit Versionsheader) */
{
int32 magic; /* Strukturkennung 'cbtm' */

You should really consider following Roland Sevin's advice (and link). That should solve all the problems above. And besides dynamic libraries are a nice thing !

It is, that is what I was trying to say. Every card can have a different
storage method, and the VDI loaded on the machine knows how to deal
with it, so it's effectively transparent to the programmer.
So if you call vr_trnfm() the VDI handles the transformation for you
regardless.

vr_trnfm() is always available as well.

Outside of this method you would have to have dev info for every
card and know the memory format and code custom routines, then
when some new card comes out, your code will probably break.
Not to mention detecting all known cards.

The way I see it you only have to convert it to one format, and then
let the VDI on the target machine transform it. But then on the
other hand I don't really know what specificly you are trying to do.

3919. [GEMScript] How to ?

Newsgroup: comp.sys.atari.programmer
Date: 2000-03-07 00:00:00 UTC
From: ptonthat@club-internet.fr
Message-ID: <8a3tqa$hn5$1@front2.grolier.fr>
Source record: 2238

Bonjour :)

I'm implementing (or trying to) GEMScript in Joe. Studying the
German developper documentation,

1) I would like to know if the commands are case-sensitive like in
common scripts or C language.

for example, read in the doku: Save
and in FreeBase doku : save

2) Moreover, how the GS_ACK with string answer and successful call
differs from GS_ACK with message failure, I didn't manage to uncipher
this part.

3) Where can I find the interpretor for .SIC files? There's the
Scripter from ASH, but I (wronly?) think it's a commercial and
expensive product. Is there another free?

4) During the execution of the script, is the controlled application
responsive for others events (such as user keypress or mouse click)?
What must be the application's behavior?

Thanks for answering

bye

No, they are *not*, use stricmp().

> how the GS_ACK with string answer and successful call
> differs from GS_ACK with message failure

You can only know by msg[7]. GSACK_OK is success, every other value is failure. Even if GS_COMMAND fails, GS_ACK can return the reason for failure as an ASCIIZZ text in msg[5/6].

If an application receives GS_ACK with msg[5/6] != NULL (regardless of success or failure), the application has to send GS_ACK back to the original sender of GS_ACK (see GEMScript hyper text, section "GS_ACK").

> Where can I find the interpretor for .SIC files? There's the
> Scripter from ASH, but I (wronly?) think it's a commercial and
> expensive product. Is there another free?

You're looking for Mark Wherry's SimpleScript:

http://www.cix.co.uk/~mark_wherry/sscript/

> During the execution of the script, is the controlled application
> responsive for others events (such as user keypress or mouse click)?
> What must be the application's behavior?

If you want your application to be locked during execution, implement calls like lock/unlock which must be called explicitly by the script.

BTW: My GEMScript home page is online again:

http://www.snailshell.de/GEMScript/

bye, Thomas

Fine, but the next one will occure, if your program is running under
memory protection. ;-) The BubbleGEM buffer must be allocateted global!
You should better use someting like this:

```
' Call this function once somewhere in your startup code:
mxmask%=@mxmask
' ...
'
FUNCTION mxmask
$F%
IF GEMDOS(68,L:-1,0)=-32
RETURN 0
ELSE IF GEMDOS(290,-1)=-32
RETURN 3
ELSE
RETURN -1
ENDIF
ENDFUNC
'
' Call this function if you need memory which will be used by other
' applications (AV-protocol, BubbleGEM ...)
' ...
bubblebuf%=mxalloc_global(256)
'
FUNCTION mxalloc_global(amount%)
$F%
IF mxmask%<>0
RETURN GEMDOS(68,L:amount%,&X100011 AND mxmask%)
ELSE
RETURN MALLOC(amount%)
ENDIF
ENDFUNC
```

I downloaded screen.ldg and the main library. I am having some problems with getting the so-called example provided with the main kit to work. The ldg_exec(ldg, "screen.ldg") call fails for some reason. I think I set everything up properly:
- LDG manager is loaded
- LDGPATH, LDG_GARBAGE, LDG_IDLE enviromental variables are set
The whole documentation is in French, so there might be something I am doing wrong.

Do you have some basic examples for GNU C - unfortunately there is almost no examples provided with the dev. kit. I really think it could work.

Thanks,

Nenad

Sorry, I should have probably used singular ("a routine") - but still,
this conversion to planes, does present a problem.

Hm, yes. Well, I wouldn't mind this requirement for NVDI 5, it's just
that they didn't think it would be necessary to support GNU C as well.

Cheers,

Nenad

Joakim Hï¿½gberg <gokmase@my-deja.com> writes:
> I was not aware that there might be problems with MALLOC under memprot.

There isn't, but there's a problem on TT and Falcon TOS: Both crash or exhibit other strange behaviour when Mxalloc() is called with memory protection flags. Thus, the code Ulli provided ensures that the memory protection flags are masked off before a call to Mxalloc() is being made when there's no memory protection.

Note that the code doesn't atually test for memory protection, but for the existance of the Sysconf()-call. This is a GEMDOS call present in all versions of MiNT supporting memory protection, but not in TOS or MagiC. Andreas Kromke agreed that - if he implemented memory protection - MagiC would get this call, too.

Ciao

Thomas

>
>Undefined symbol GEMformwindow::GEMform virtual table referenced from
>text

Dunno - comes across as cryptic in this context. Methinks you'd have to have seen this error in a less complex situation to figure out what it really means. It *appears* to be saying that class "GEMformwindow" has a method named "GEMform", for which a definition could not be found.

If I were to hazard a guess at the cause - look for what appears to be its definition, then "grep" elsewhere for all the code that calls it. It's possible that in this compilation attempt GCC has overloaded a GEMform() which "it should not have" (ie check datatypes being passed).

>Undefined symbol _InFocus__13GEMformwindowb referenced from text

Dunno - looks mangled but it doesn't match the below!

>Undefined symbol GEMformwindow::~GEMformwindow() referenced from text

Odd. Where's the GEMformwindow destructor? Is there one, or has it been implicitly supplied by the compiler. If the latter then check compilation options - the feature may not be enabled. (ie empty ctor/dtor will be generated for you by default - this may not be happening).

>Undefined symbol ___ti13GEMformwindow referenced from text
>Undefined symbol ___tf7GEMmenu referenced from text
>Undefined symbol ___ti7GEMmenu referenced from text

The above look like mangled names. Again, this could be down to "accidental overloading".

>gemw.o: Undefined symbol __intin referenced from text
>gemw.o: Undefined symbol __intin referenced from text
>gemw.o: Undefined symbol __intin referenced from text
>gemw.o: Undefined symbol ___aes__ referenced from text
>gemw.o: Undefined symbol __intout referenced from text
>gemw.o: Undefined symbol __intout referenced from text

The ones above look suspiciously like you have omitted to link in the
module that defines the "parameter passing arrays" for talking to Gem.
It might be a compiler option or it might be a module. However, it is
possible that you're required to define them yourself.

>Does anybody know what I might be doing wrong (again) :)

'Fraid I've never used GCC - a user of GCC would, of course, know
better!

> Desde hace unos d as estoy buscando la forma de ganar dinero en
> Internet, he recorrido grupos de noticias, tablones, avisos
> clasificados...
> En todos estos lugares encuentro mensajes como el que reproduzco m s
> abajo.
> Me qued pensando: Es simplemente una cadena, esto es algo que no
> anda...
> y si funciona?. Esto no es algo nuevo, ya se hace desde d cadas y no s
> de nadie que haya hecho dinero... Y si funciona?. Pens ndolo bien es un
> verdadero trabajo... y si funciona?...Al final me decid y aqu estoy.
> Si tu tambi n te decidiste o estas dudando, sigue leyendo.
> No creas que va a ser f cil, es necesario colocar este mensaje en todos
> los lugares que se te ocurra publicarlo, news, tablones, avisos
> clasificados, etc. cuando mayor sea la cantidad de veces que lo repitas
> mejor para ti (y para mi por supuesto, ya ver s) por eso te digo que es
> un verdadero trabajo, te va llevar varias horas, va requerir de toda tu
> experiencia, tambi n va a depender de tu constancia para seguir
> publicando y tu habilidad para promocionarlo (pero no te preocupes). La
> diferencia con lo que se hac a antes con el correo tradicional es que
> esta cadena no depende de cinco o diez personas a las que les llega el
> mensaje, sino que es para todo el mundo, y en Internet hay miles de
> personas que ver n el aviso y alguna (como yo) se va a decidir.
> Y por ltimo Has pensado cu nto puedes aprender en una tarea como
> esta, para aplicarla en trabajos futuros?
> Yo soy ahora el ltimo de la lista que vas a encontrar y donde (si
> sigues adelante) vas a estar tu al repetir el mensaje, dej ndome
> pen ltimo, te deseo suerte, ya que tambi n parte de esta suerte va a ser
> para m .
> Este es el mensaje que encontr :
> (NO ME HAGO CARGO DE LAS FALTAS DE ORTOGRAFIA DE LO QUE SIGUE):
> Esto es lo que le pas a un amigo:
> D as atr s, cuando navegaba por estas p ginas de Noticias, as mismo
> como Ud. lo esta haciendo ahora, se me apareci un art culo similar a
> este que dec a que uno puede ganar miles de d lares en pocas semanas con
> una inversion de $6.00!. Enseguida pens , Oh no! otra estafa mas?, pero
> como la mayoria de nosotros, la curiosidad pudo mas, y segu leyendo.
> Segu a diciendo que Ud. enviar $1.00 a cada uno de los 6 nombres y
> direcciones mencionados en este art culo. Entonces Ud. anota su nombre y
> direcci n al final de la lista reemplazando al #6, y envie o ponga este
> art culo a por lo menos 200 newsgroups(Hay miles de estos en todo
> elmundo).

> No hay truco, eso fue todo. La gran diferencia entre este sistema y
> otros es que Ud. tiene una lista de 6 en vez de 5... Esto significa que
> su promedio de ganancia sera aproximadamente 15 veces mayor!!! Despu�s
> de pensarlo una y otra vez, y consultar con unos amigos primero, decid�
> probarlo. Pens� que lo �nico que podria perder eran 6 estampillas
> (sellos de correos) y $6.00, verdad?.
> Como probablemente muchos de nosotros, estaba un poco preocupado por la
> legalidad de todo esto. Entonces investigu� en la ley internacional de
> Correos Internacionales de Am�rica y observe que en el articulo 4� dice
> que en este tipo de sistema de traslados de dinero en cantidades m�nimas
> era absolutamente legal.
> Entonces invert� mis $6.00.....IMAGINENSE QUE!!!...a los 7 d�as,
> empec� a recibir dinero por correo!!!. Estaba sorprendido! Todavia
> pensaba que esto terminar�a enseguida, y no pens� mas en otra cosa. Pero
> el dinero seguia llegando. En mi primera semana hice unos $20.00 a
> $30.00 d�lares. Para el final de la segunda semana tenia hecho un total
> de m�s de $1,000.00!!!!! En la tercer semana recib� m�s de $10,000.00 y
> todavia seguia llegando m�s. Esta es mi cuarta semana ya hice un total
> de m�s de $41,000.00 y esto sigue llegando m�s rapidamente (mi esposa e
> hijos se pasan abriendo los sobres y yo consiguiendo Newsgroup). Esto se
> puso serio!!!! Todo esto realmente vali� la inversi�n de $6.00 y 6
> estampillas (sellos). Me gastaba m�s que esto en sorteos y loterias!!
> Perm�tanme explicarles como funciona esto y lo mas importante el porqu�
> funciona....tambi�n, Ud. aseg�rese de imprimir una copia de este
> art�culo AHORA, para poder sacar toda la informaci�n a medida que lo
> necesite.
> El proceso es muy facil y consiste en 3 pasos sencillos:
> PASO No. 1:
> Obtenga 6 hojas de papel y escriba en cada una de ellas FAVOR DE
> INCLUIRME EN SU LISTA DE CORRESPONDENCIA O E-MAIL. Ahora consiga 6
> billetes de US$1.00 dolar e introduzca cada dolar en un sobre con la
> hoja de manera que el billete no se vea a trav�s del sobre!!
> Mejor ponerlo encerrado en un papel de color oscuro para prevenir robos
> de correspondencia. Ahora Ud. deberia tener 6 sobres sellados y en ellos
> un papel con la frase mencionada, su nombre y direcci�n, y un billete de
> $1.00 dolar. Lo que Ud. Esta haciendo con esto es crear un servicio
> y eso hace que esto sea ABSOLUTAMENTE LEGAL!!
> Enviar los 6 sobres a las siguientes direcciones:
>
> #1 Graciela Caceres
> Canelones 1365 Apto.3,
> C.P. 11200
> Montevideo, Republica Oriental del Uruguay
>
> #2 Rodrigo Cabrales
> Av. Per# #784 dpto. A - RECOLETA
> Santiago-CHILE
>
> #3 Jose L. Giron

> c/ C�firo N.9 2�-b
> 41018
> Sevilla
> Espa�a
>
>
> #4 Luis Guti�rrez
> Villaviciosa de Od�n - C.P. 28670
> Madrid - Espa�a
>
> #5 Antonio Aparicio
> C/. Feliu i Codina, 45 2� 3� Esc. B
> 08031 Barcelona (ESPA�A)
>
> #6 Alberto Aguinaga San Mart�n
> C/ I�igo Arista 14 - 6C
> C.P. 31007 Pamplona (NAVARRA)
> ESPA�A
>
> PASO No. 2:
>
> Ahora elimine el #1 de la lista de arriba y mueva los otros nombres un
> n�mero para arriba (el #6 se convierte en #5, el #5 se convierte en #4,
> Etc.) y agregue SU NOMBRE y direcci�n como el #6 en la lista.
>
> PASO No. 3:
>
> Cambie todo lo que crea conveniente de este art�culo, pero trate de
> mantenerlo lo mas posible cercano al original. Ahora ponga su art�culo
> en por lo menos 200 newsgroups(existen mas de 24,000 grupos). Solo
> necesita 200, pero cuando mas cantidad lo ponga, mas dinero le
> llegar�!!!.
> Aqu� van algunas indicaciones de como introducirse en los newsgroups:
>
>
> ---
> COMO MANEJAR LOS NEWSGROUPS
> ---
> No.1 Ud. no necesita redactar de nuevo toda esta carta para hacer
> la suya propia. Solamente ponga su cursor al comienzo de esta carta,
> haga click y lo deja presionando y b�jelo hasta el final de la carta y
> l�rguelo.
> Toda la carta deber� estar sombreado. Entonces, apunte y haga click en
> edit arriba de su pantalla, aqu� seleccione copy. Esto har� que todala
> carta quede en la memoria de su computadora.
> No.2 Abra un archivo notepad y lleve al cursor arriba de la p�gina
> en blanco. Presione edit y del menu seleccione paste. Ahora tendr�
> esta carta en el notepad y podr� agregar su nombre y direcci�n en el
> lugar #6 siguiendo las instrucciones de mas arriba.

> No.3 Grave esta carta en su nuevo archivo del notepad como
> un .txt file. Y cada vez que quiera cambiar algo ya lo puede hacer.
>
> ---
> PARA LOS QUE MANEJAN NETSCAPE
> ---
> No.4 Dentro del programa Netscape, vaya a la ventana
> titulada :Window y seleccione netscapeNews. Entonces elija del menu
> Options, seleccione Show all Newsgroups. En segundos una lista de
> todos los Newsgroups de su server aparecer�. Haga click en cualquier
> newsgroup.
> De este newsgroup haga click debajo de TO NEWS, el cual deberia estar
> arriba, en el extremo izquierdo de la p�gina de newsgroups. Esto le
> llevar� a la caja de mensajes.
> No.5 Llene este espacio. Este ser� el t�tulo que ver�n todos
> cuando recorran por la lista de un grupo en particular.
> No.6 Marque el contenido completo del .txt file y copie usando
> la misma t�cnica anterior. Regrese al Newsgroup TO NEWS y Ud. esta
> creando y empastando esta carta dentro de su programa o posting.
> No.7 Presione send que est� en la parte superior izquierda.
> Y UD. HA FINALIZADO CON SU PRIMERO!...CONGRATULACIONES!!! .
>
> ---
> LOS QUE USAN INTERNET EXPLORER
> ---
> PASO No. 4: Vaya al Newsgroups y seleccione Post an Article.
> PASO No. 5: Carge el art�culo.PASO No. 6: Repita el No.6 mas arriba.
> PASO No. 7: Presione el bot�n Post.
> ---
>
> ESTO ES TODO!. Todo lo que tiene que hacer es meterse en diferentes
> Newsgroups y empastarlos, cuando ya tenga pr�ctica, solo le tomar� unos
> 30 segundos por cada newsgroup!
> **RECUERDE, CUANTOS MAS NEWSGROUPS CONSIGA, MAS RESPUESTAS (Y DINERO)
> RECIBIRA!! PERO DEBE DE ENTRAR EN POR LO MENOS 200**
> YA ESTA!!!.... Ud. estar� recibiendo dinero de todo el mundo, de lugares
> que ni conoce y en unos pocos d�as!. Eventualmente querr� rentar un
> P.O.Box por la cantidad de sobres que ir� recibiendo. Si prefiere usar
> sobrenombres, puede crear un nombre toda vez que el cartero entrege
> donde debe.
> **ASEGURESE DE QUE TODAS LAS DIRECCIONES ESTEN CORRECTAS
> Ahora el POR QUE de todo esto:
> Tomemos un ejemplo:
> * De 200 enviados, digamos que recibo solo 5 respuestas (baj�simo
> ejemplo). Entonces hice $5.00 con mi nombre en la posici�n #6 de esta
> carta.
> * Ahora, cada uno de las 5 personas que ya me enviaron los $1.00 tambi�n
> hacen un m�nimo 200 newsgroups, cada uno con mi nombre en el #5 de la
> lista y solo responden 5 personas a cada uno de los 5 originales, esto

> hace $25.00 mas que yo recibo,
> * ahora estas 25 personas pone un m�nimo de 200 Newsgroups con mi nombre
> en el #4 y solo se recibe 5 respuesta de cada uno. Estar�a haciendo
> otros $125.00 adicionales.
> * Ahora esta 125 personas ponen sus m�nimo de 200 grupos con mi nombre
> en el #3 y solo recibe 5 respuestas cada una, yo recibo un adicional de
> 625.00!.
> * OK, aqu� esta la parte mas divertida, cada una de estas 625 personas
> ponen sus cartas en otros 200 grupos con mi nombre en el #2 y cada una
> recibe solo 5 respuestas, esto hace que yo reciba $3,125.00!!!.
> *Estas 3,125 personas enviar�n este mensaje a un m�nimo de 200
> Newsgroups con mi nombre en el #1 y si solo 5 personas responden de los
> 200 grupos, estar� recibiendo $15,625.00!!.
> De una inversion original de $6.00!! mas estampillas(sellos). FABULOSO!
> Y como dije antes, que solo 5 personas respondan muy poca, el promedio
> real seria 20 o 30 personas!. Asi que pongamos estos n�meros m�s a
> calcular.
>
> Si solo 15 personas responden, esto hace:
> en la #6 $15.00
> en la #5 $225.00
> en la #4 $3,375.00
> en la #3 $50,625.00
> en la #2 $759,375.00
> en la #1 $11,390,625.00 (imaginate)
> .....si, mas de ONCE MILLONES DE DOLARES!!!
>
> Una vez que su nombre ya no esta en la lista, saque el ultimo anuncio
> del Newsgroup y envie otros $6.00 a los nombres en esa lista, poniendo
> su nombre en el #6 y repetir todo el proceso. Y empezar a ponerlos en
> los Newsgroups otra vez.
> Lo que debe recordar es que miles de personas mas, en todo el mundo, se
> conectan al Internet cada d�a y leer�n estos art�culos todos los d�as
> como USTED Y YO LO HACEMOS!!!.
> As� que creo nadie tendr�a problemas en invertir $6.00 y ver si
> realmente esto funciona. Algunas personas llegan a pensar...y si nadie
> decide contestarme?
> Que!! Cu�l es la chance de que esto pas� cuando hay miles y miles de
> personas honestas (que como nosotros) buscan una manera de tener
> independencia financiera y pagar cuentas!!!., y estas dispuestas a
> tratar, pu�s No hay peor lucha de la que no se hace. Se estima que
> existen de 20,000 a 50.000 nuevos usuarios TODOS LOS DIAS! (en todo
> elmundo)
>
> *******OTRO SISTEMA PARA COMUNICARSE ES CONSIGUIENDO E-MAIL DE PERSONAS
> PARTICULARES, DEBE SER POR LO MENOS 200 DIRECCIONES, Y ESTO TIENE UNA
> EFECTIVIDAD DE MINIMO 5% AL 15%. SI SOLO BUSCAN PERSONAS QUE HABLAN EN
> ESPANOL, VAYAN A UN PROVEEDOR DE E-MAILS E IMPRIMAN UN APELLIDO LATINO Y
> YA.

>
> **********Recuerde de hacerlo esto en forma CORRECTA , LIMPIA Y
> HONESTAMENTE y
> funcionar&#65533; con toda seguridad. Solamente tiene que ser honesto.
> Asegurese de imprimir este art&#65533;culo AHORA, Trate de mantener la lista de
> todos los que les envian dinero y siempre f&#65533;jese en los Newsgroups y vea
> si todos est&#65533;n participando limpiamente. Recuerde, HONESTIDAD ES EL
> MEJOR METODO.
> No necesitas hacer trucos con la idea b&#65533;sica de hacer dinero en esto!
> BENDICIONES PARA TODOS, y suerte, juguemos limpio y aprovechar esta
> hermosa oportunidad de hacer toneladas de dinero con el internet.
>
> **Dicho sea de paso, si Ud. defrauda a las personas poniendo mensajes
> con su nombre y no envia ning&#65533;n dinero a los dem&#65533;s en esa lista, Ud.
> recibir&#65533; casi NADA!.
> He conversado con personas que conocieron a otras que hicieron eso y
> solo llegaron a colectar unos $150.00, y eso despu&#65533;s de unas 7 semanas!.
>
> Algunos decidieron probar otra vez, haciendo correctamente, y en 4 a 5
> semanas recibieron mas de $10.000. Esto es la m&#65533;s limpia y honesta
> manera de compartir fortuna que yo jam&#65533;s haya visto, sin costarnos mucho
> excepto un poco de tiempo. El TIEMPO ES IMPORTANTE!, no dejar pasar mas
> de 7 d&#65533;as del momento que vea este art&#65533;culo!. Tambi&#65533;n puede conseguir
> lista de E-MAIL para extra d&#65533;lares. Sigamos todos las reglas del
> negocio! Recuerde mencionar estas ganancias extras en sus declaraciones
> de impuestos.
>
> Gracias otra vez y BENDICIONES A TODOS!!..
>
&#65533; Hola a todos:
>
> Desde hace unos d&#65533;as estoy buscando la forma de ganar dinero en
> Internet, he recorrido grupos de noticias, tablones, avisos
> clasificados...
> En todos estos lugares encuentro mensajes como el que reproduzco m&#65533;s
> abajo.
> Me qued&#65533; pensando: Es simplemente una cadena, esto es algo que no
> anda...
> &#65533;y si funciona?. Esto no es algo nuevo, ya se hace desde d&#65533;cadas y no s&#65533;
> de nadie que haya hecho dinero... Y si funciona?. Pens&#65533;ndolo bien es un
> verdadero trabajo... &#65533;y si funciona?...Al final me decid&#65533; y aqu&#65533; estoy.
> Si tu tambi&#65533;n te decidiste o estas dudando, sigue leyendo.

>
>I honestly had no idea there was such a newsgroup.
>Anyone have the full group names for these?

I'd carry on using the main echo's, a test message being posted usually
starts up quite a healthy thread on the relevant software, and is usually
the only worthwhile traffic.. 8~)

Almost all internet provider with its own newsserver provides a local
test group, maybe something like bright.test for you, I don't know.

Also, there's a test group for almost all toplevel news hierachies, e.g.
alt.test, de.test, fr.test, uk.test, ... Many of those are watched by
"reflectors", i.e. you'll get an email response when they "see" a
message from you.

Ciao

Thomas

Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st.tech,comp.sys.atari.st,de.comp.sys.atari,comp.sys.atari.advocacy, maus.computer.atari.falcon

Hello,

I search of documentation on the structures of file RSC. I created a program to extract the icones from 2 to 256 colors of the files Windows ICO and CUR (files DLL, EXE and OCX in progress). I would like to record them in a file RSC with format CICON. The documentation which I have (Compendium, Atari developor divides into volumes 1 and 2) are a little light on this subject. I saw well the structure RSHDR in PURE C, but no documentation on the pointers of objects. I believed to understand that there was a file RSCREATE.C which would seem well to answer my request. Can you help me to find it. Thank you by advance.

Well I tried to get alt.test and did, but geesh it was huge,
something like 11,000+ msg's and so I gave up. My solution
will be if I need a test, I'll reply to a post as usual and
hope like heck it works. ;-)

Unfortunately Mark Wherry seems to have gone into deep hibernation - that
web site has been down for a long time now.

May I suggest GEMScript as an alternative? The author states that it will
interpret Scripter scripts, I don't think that Mark's will. I don't have a
URL to hand I'm afraid...

Thanks a lot Guy for your suggestions! Too bad you were the only one
who noticed my post...
I think the problem is that the gem++ library was built using some
earlier version of GCC, most likely 2.5.8 and there are some things the
2.8.1 version is simply more sensitive about.
Is there anyone out there who has maybe rebuilt the library with some
of the newer versions of GCC, I think that would be worth it? I tried
it myself, but I just don't have neither enough patience/time nor
experience.
Warwick Allison left the Atari platform and is now working on Qt, so he
can't support the lib any more. Has anybody continued his work?
Thanks,
Nenad

Hi,

I'm a newbie to HiSoft Basic. I have succesfully compiled a few demo.bas files,
but others like SHELL.BAS simply won't compile. Error #65.
Other demo's needed large buffers etc. and the right path settings but with
this one nothing I've tried works. Anybody who can help a bit?
Thanks in advance!

3948. OVL's and GFA

Newsgroup: comp.sys.atari.programmer
Date: 2000-03-20 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <38d5c0b1$1_1@athena.netset.com>
Source record: 2017

Anyone ever write a GFA program for accessing an OVL module?

I have the understanding of how to do it in C. But am looking for
some way that wouldn't be a bear in GFA.

I'm not wrting the GFA section and it's been years since I've
really worked with GFA so I've come to you fine folks for help.

The question is how to pass back a pointer to an API structure to
the Parent application (GFA program), without making the parent
application search through memory for a magic string. Is it possible? It
seems like there should be some nice trick for doing this, but so far it's
escaping me.

Any ideas or input would be greatly appreciated!

Dan Ackerman
aka baldrick...

Is it possible to load an OVL and then execute it, apon which
the return value is a pointer to a list of pointers within the OVL?

I really don't know how OVL's are dealt with, but this idea
struck me when I read your post. I'd be interested to know
how they are handdle in "C" if you can explain that in terms
us GFA users can grasp. ;-)

I was about ready to go through your example in detail to lp.

I'll have to go back over the code, I thought this is what you
were doing with the code you sent me some years ago. I'm just too tired
right now to parse any of it.

So when are you going to come back home and program some Atari
stuff :)

Come on you know you want to do it!

Lp you have your PUG interface code still around?

As to the messaging you asked about. I had thought about
that. It would be simple to send a message back to the parent advertising
a memory address for the init. However to do this would either involve
breaking the address up or sending it as a long. I'm certain there are a
few people around here that would argue against sending anything other
than the 8 int array that AES messages are currently made up of.

That bit of code I got you to write for PUG did exactly what you've
surmised here. I keep meaning to bung what I've got left on my website
when time permits. In the meantime, I've tagged the relevent sections
into my reply to Dan.

A Pexec(3),Pexec(4) combo was what I ended up with - 'twas the only
thing that worked 100% reliably even with the oldest Gem.

Contents of pugbind.c - Lonny recoded this in GFA yonks back and it
worked. It was to be the only language dependant part of using PUG...

/*
This source should be included in your makefile dependant on PUG.H

It is responsible for locating and loading the module PUG_MOD. It
first looks
in the current directory. This may fail under multitasking so it then
looks
at the executable path and replaces the executable name with PUG_MOD.

Having loaded the module, it executes it so that PUG_MOD can hand back
memory
via PtermRes().

It then proceeds to locate the header and writes the PUGFUNC structure
pointer
to the caller's space for subsequent access to the overlay's
functions.

It returns zero for failure or non zero for success, in which case the
value is
the version number. The high word contains the major version number
and the
low word contains the minor version number.
```

```
*/

#include <basepage.h>
#include <osbind.h>
#define DEF_LIB_ONLY
#include <libc.h>
#include "pug.h"

sint memcmp();
char *strrchr();
char *strchr();

ulong
Pug(pug_mod,pfpp)
char pug_mod[];
PUGFUNC **pfpp;
{slong r;
BASEPAGE *bp;
slong i;
char *p,
s[256];
sint h;

/* ?module exists in PUG environment? */
if (p = getenv("PUG")) {
strcpy(s,p);
strnextdir(s,pug_mod,false);
}
else
/* ?module exists in current directory? */
if ((h = Fopen(pug_mod,0)) < 0) {/* no */
/* get executable directory */
shel_read(&s[0],&s[128]);
/* remove executable name */
if (
((p = strrchr(s,'\\')) == NULL) &&
((p = strchr(s,':')) == NULL)
)

p = &s[-1]
;
/* add module name */
strcpy(&p[1],pug_mod);
}
else {
Fclose(h);
strcpy(s,pug_mod);
}

/* ?module overlay loaded? */
if ((r = Pexec(3,s,NULL,NULL)) < 0) {/* no */
sprintf(s,"[3][Pexec(3) failed|Code %d|File %s][Typical]",
```

```
(int)r,pug_mod
)
;
form_alert(1,s);
return 0;
}

/* execute module startup (Ptermres to hand back unused TPA) */
bp = (BASEPAGE*)r;
Pexec(4,NULL,bp,NULL);

/* search module data segment for header */
/* kludge for development version */
/* saves manually ensuring header is linked at start of data segment
*/
p = (char*)bp->p_dbase;
for (i = 0; i < bp->p_dlen; i++) {
if (memcmp(p + i,PUG_HDR_TXT,PUG_HDR_LEN) == 0) {/* header
found */
/* set function pointer structure */
*pfpp = p + i + PUG_HDR_LEN + PUG_VER_LEN;
/* version number */
return *((ulong*)(p + i + PUG_HDR_LEN));
}
}

sprintf(s,"[3][PUG Overlay %s|Cannot locate
header][Typical]",pug_mod);
form_alert(1,s);
return 0;
}
```

So basically, the caller is supposed to have passed the address of a PUGFUNC structure pointer to the above function. Extract of pug.h, in good old MWC K&R of course...

```
/* access to functions */
typedef struct {
void (*pg_enable)(); /* "ignition on" */
void (*pg_disable)(); /* "ignition off" */
PUG* (*pg_mem)(); /* dynamic memory managment */
bool (*pg_new_dial)(); /* open/top window */
bool (*pg_old_dial)(); /* close window */
uint (*pg_dialogue)(); /* evnt_multi() replacement */
uint (*pg_obstate)(); /* change object ob_state
intelligently */
uint (*pg_obflags)(); /* change object ob_flags
intelligently */
void (*pg_force)(); /* (ud) force redraw if at all
possible */
uint (*pg_evm)(); /* (ud) direct EVM access */
char* (*pg_obstr)(); /* write string to object
```

```
intelligently */
void (*pg_centre)(); /* centre window (obsolete) */
void (*pg_underline)(); /* keyboard shortcut conversion */
void (*pg_hide)(); /* move window offscreen */
void (*pg_show)(); /* bring window back onscreen */
char* (*pg_exepath)(); /* return executable path */
void (*pg_pos)(); /* set window position */
bool (*pg_nxt_dial)(); /* close this window, open next */
sint (*pg_is_mine)(); /* (ud) return PUG handle for AES
window */
bool (*pg_init)(); /* (ud) complex window initiator */
bool (*pg_term)(); /* (ud) complex window terminator */
ulong (*pg_dyn)(); /* (d) very high level memory
management */
sint (*pg_list)(); /* scrollable objects */
bool (*pg_name)(); /* set WF_NAME */
bool (*pg_info)(); /* set WF_INFO */
void (*pg_fitdesk)(); /* (ud) force large window to be sized
down */
/*
* ud as yet & possibly transient ...
* included to get a feel for if these should be included in their own
* right or buried within other functions
*/
void (*pg_logging)(); /* (stub) could be used for trace
level */
void (*pg_log)(); /* user logging function */
void (*pg_edoff)(); /* force (already enabled) cursor off
*/
void (*pg_edon)(); /* try to turn on (disabled) cursor */
void (*pg_msg)(); /* send a AES message */
/*
* new ...
*/
sint (*pg_alert)(); /* alert in a window */
sint (*pg_printf)();
uint (*pg_gs_wk)();
sint (*pg_gs_wh)();
OBJECT* (*pg_gs_ob)();
int (*pg_gs_obi)();
bool (*pg_gs_act)();
int (*(*pg_gs_uiv)())();
OBJECT* (*pg_gs_icob)();
char* (*pg_stem)();
bool (*pg_bubblegem)();
char* (*pg_rsc)();
} PUGFUNC;
```

And finally, the imaginately named pug01.c to round off...

```
#include "pugg.h"
```

```
extern int global[];

void
pug_enable()
/*[ void pug_enable()

Once the PUG overlay module PUG_MOD has been loaded by PUG then
pug_enable()
must be issued so that the overlay and the user process can
communicate as one
with GEM.
]*/
{
appl_init();

/* resource file header pointer */
global[5] = global[6] = 0;
}

void
pug_disable()
/*[ void pug_disable()

Separates the user process from the overlay prior to program
termination.
It does not unload the overlay.
]*/
{
/* some desktops will update their windows */
sm_drives(NIL);

appl_exit();
}

Oh, nearly forgot. In a *very* loose manner, an app would do this to
get things started...

PUGFUNC *gl_pfp;

main()
{
Pug(PUG_MOD,&gl_pfp);
pug_enable();

//app here

pug_disable();
appl_exit();
exit(blah);
}

...where the actual PUGFUNC struct is a simple asm source, mirroring
the C declaration, which is pulled into the overlay by the linker...

Okay, somewhat involved for the overlay author (it isn't really - just "dumb coding") but more importantly there is very little required of an overlay *user*, as is apparent from the slimness of main() - unlike myself, who seems to grow less slim each waking day. I digress. Time for bed. <G>

3953. Reset routine

Newsgroup: comp.sys.atari.programmer
Date: 2000-03-29 00:00:00 UTC
From: Michael Nau <m.nau@tu-bs.de>
Message-ID: <38E1FD44.167C4619@tu-bs.de>
Source record: 2022

Hi!

Can anyone show me how to reset the Atari system? I need it for a
shutdown manager. I'd prefer a clean method, elsewhere a dirty hack
might do as well.

Thanks, Michael.

If that is what you are talking about:
jmp ([$4.w])
(trash some memvalid-like system variables to perform a cold one)
oups sorry, 68000 version here:
move.l $4.w,a0
jmp (a0)

IIRC you can use _sysbase systeme variable to do this also:
move.l _sysbase.w,a0
jmp (a0)
```

```
You should shut down all the applications first.

To do a soft reset, look at the address in memory address 4. Get this
address and jump to it.

Here are two ways in assembly (in super mode)

move.l 4,-(sp)
rts

OR

move.l 4,a0
jmp (a0)

Hi Guillaume!

GD>IIRC you can use _sysbase systeme variable to do this also:
GD> move.l _sysbase.w,a0
GD> jmp (a0)
Which is the more clean way since it points to the OS header of the currently running OS. $4.w does always point to the ROM's one

Under MiNT always use Shutdown(long restart) system call (0x151).

3958. Some example OVL code in C

Newsgroup: comp.sys.atari.programmer
Date: 2000-03-30 00:00:00 UTC
From: baldrick@dilbert.netset.com
Message-ID: <38e38ef0$1_2@athena.netset.com>
Source record: 2027

I've put together a small archive at my site that shows at least
one method of implementing and using an OVL file. Both the OVl and client
are very simple, so it should be a good starting point for someone looking
at doing this sort of thing. The OVl only has 3 stub routines, just
enough to operate and show that it's working. Enough I think to
illustrate the method.

While in a way we are moving away from the idea of OVl files, I
think they still have situations where they are useful. So if you are
interested in how to use/create an OVL file grab the file.

http://www.netset.com/~baldrick/products.html

Maybe someday I'll round up some GFA examples for this as well.

Dan Ackerman
aka baldrick...

Hi!

In article <38E1FD44.167C4619@tu-bs.de>,
Michael Nau <m.nau@tu-bs.de> writes:
> I'd prefer a clean method, elsewhere a dirty hack might do as well.

OK, you've asked for it, you get it ;)

```
static long get_reset(void);

void reboot(void)
{
long r,
reset_address;

/* First, try using MiNT's Shutdown() call */
r = Shutdown(1); /* GEMDOS 0x151 */

/* If it returns, then either the current GEMDOS doesn't support
* Shutdown(), or Shutdown() failed for some reason
*/
if (r != -32L)
{
/* System supports Shutdown(), but it failed */
return;
}

/* OK, system does not support Shutdown(), so let's use the old way */
reset_address = Supexec(get_reset);
Supexec((void *)reset_address);

/* Mhmm, Supexec() returned, something must have went wrong ... */
}

static long do_reset(void)
{
/* Get contents of address 4, which contains a copy of bytes 4 to 8
* of the TOS header, which in turn resemble the start of the reset
* routine (the MC68xxx family uses the contents of address 0 for
* SSP, and the contents of address 4 for PC on power-up or
* hardware-reset)
*/
return (*(long *)0x4);
}
```

If the function reboot() returns to the caller, something very strange
has happened ...

Of course, in assembler this can be done a lot shorter, but this way it should be more comprehensible.

Ciao

Such a RAM-disk won't survive a reset with both resvector and one of the
memvalid variables cleared. Of course, you can still play tricks using
the PMMU to completely avoid resets, but a software-triggered cold-boot
will kill reset resident stuff.

Ciao

You want to make copies of data file cassettes? Play on one and record on the
other. (which is how I used to make copies of Zaxxon 15 years ago, their
ridiculous copy protection only made loading the game harder to do). The
cassettes are audio. You might want to clean the heads on the cassette
players, it don't take much to screw up the recordings.

LEGAL CABLE TV DE-SCRAMBLER

Want to watch Sporting Events?--Movies?--Pay-Per-View??

*This is the Famous R-O Shack TV Descrambler
You can assemble it from Radio Shack parts for about $12 to $15.

We Send You:
1, E-Z To follow Assembly Instructions.
2. E-Z To read Original Drawings.
3. Total Parts List.

**** PLUS SOMETHING NEW YOU MUST HAVE! ****
Something you can't do without.

THE UP-TO-DATE 6 PAGE REPORT:
USING A DESCRAMBLER LEGALLY

Warning: You should not build a TV Descrambler without
reading this report first.

Frequently Asked Questions--CABLE TV DESCRAMBLER

Q: Will the descrambler work on Fiber, TCI, Jarrod
and satellite systems?
A: The answer is YES. In respect to satellite,
you just get more stuff! There is one exception:
The descrambler will not work with DSS satellite.

Q: Do I need a converter box?
A: This plan works with or without a converter box.
Specific instructions are included in the plans for each!
Q: Can the cable company detect that I have the descrambler?

A: No, the signal descrambles right at the box and does
not move back through the line!

Q: Do I have to alter my existing cable system,
television or VCR?
A: The answer is no!

Q: Does this work with my remote control?
A: The answer is yes. The descrambler is
manually controlled--but very easy to use!

Q: Can you email me the plans?
A: No the program comes with an easy to follow picture guide.

Q: Does this work everywhere across the country?
A: Yes, everywhere in the USA plus England,
Brazil, Canada and other countries!

Q: Is this deal guaranteed?
A: Yes, if you are unhappy for any reason we will refund your money.

Q: When I order, when will I get my package?
A: We mail out all orders within 24 hours of receiving them.

Q: How much does it cost to get the instruction
plans, the easy to follow diagram, and most
important of all the "Using a Descrambler LEGALLY Report".
A: You get the complete 6 page report and instruction package all for just--$10.00

Q: How do I order?
A: Fill out form below and send it, along
with your $10.00 payment to:

CABLE FREE-TV
12187 S. Orange Blossom Trail #116
Orlando Fl 32837

(Cash, Check or Money Order.)

(Florida residents include 7% Florida State Sales Tax)

(All orders outside the U.S.A. add $5.00)

PRINT YOUR:

Hello,
ask Bo and Ernest Schreurs about their Cas to WAV converter program...
quite interesting background story !! Besides, copying from (Hifi-)Tape
to Tape is easier and to a digital destination (like DAT, DCC, MD, CDR,
CDRW) is far secure (but wastes to much memory). greets- Andreas
magenheimer

P.S. Why not keep the cassettes as original source and use a disk-file
as backup... (if you own the original program, you are allowed to have
backups on any medium)

Hi Gadget! :)

Unlike the other repliers who seem to think this is a bit of a joke, you certainly have an application if you are using a Spectrum emulator etc.

To capture a program from tape, you could use a sound sampler and hook up your tape player either into a sound sampling cartridge on an ST or into the microphone socket on a Falcon.

There is a way to then play them into the emulator, but I've never really looked into this.

Cheers!

James

From: Ben Hills <ben@imperial.co.uk>
Message-ID: <8cjvccoua1@nnrp1.deja.com>
Source record: 2044

Hi All,

I know I have asked this before, but.....

I would still really like to be able to write GEM
programs on my Atari using GNU C++. The problem I
am having is figuring out what the latest version
of the Atari port of GNU C++ is and how I install
it. I also don't know what libraries I need to be
able to write GEM programs. I have heard about
GEM++ and GEMLIB, but again I don't know what the
latest version are, where to get them or how to
install them.

Can anybody help me out and explain to me what I
need and how I setup a complete C++ environment
on my Atari so I can start programming?

I have also been looking at a program called ACS-Pro
which looks to provide some form of visual design
for GNU C++? Does anybody know more about this program.

Thanks all.

Regards,

Ben Hills.

That depends on the command that returns a value (the return value need
not be a boolean value). If you implement a command that returns a
boolean value, you should return a non-empty string (e.g. "1") as "true"
and an empty string (or a NULL pointer) as "false".

bye, Thomas

Hello Al.

Try http://www.dhs.nu . There you will find from coding util section prg
called Assemble/Adebug 0.9
I'm not sure is it good, but I'm going to get sight for it asap.

try using Easyrider as this is a 'reassembler' as well as a disassembler.

The latest gcc which doesn't require MiNT was the 2.7.2.3.
You also need at least the mintlib and gemlib. These you
can be found on several ftp servers (e.g. ftp.funet.fi).
The easiest way to install is if you have a MiNT
environment, than you have just to copy a few files to
their destination directories.

Feel free to contact me for more details, at the moment
I'm in the office and can't reach my atari (at home) to
give you more details.

TT-Digger is in English. :-)

Are you going to disassemble Palm pilot programs? Do they have a particular binary program format (headers, symbol tables and such)? If these are different from Atari and cause difficulties, remove them with a binary editor, keeping only the code itself. TT-Digger accepts everything that is fed into it.

Interesting. I have a TT. I also have wintel laptop running Tosbox and/or Tos2Win,
I have seen it running with Gemulator and on a Milan. I further have a 1040 running
Tos 2,06.
I replaced tos 1.0 on that machine long before I started work on TT-Digger. :-)

Seeing as no-one has yet responded to this (or perhaps it's just that my ISP's news-server hasn't received it yet), I'll kick things off with a list of some of my current projects that I've worked on or am currently working on:

1) Toolbox DLL manager. It hasn't been touched in the last year or so, but seems pretty stable on the TT, ATM. I still have to write a decent programmers manual for it, and tidy up a few of the bundled utilities (Library lister, info viewer etc)

2) The stock control/invoicer program (tentatively called "Stocker") as mentioned in the now-deceased Atari Computing mag. I still have to work on printing out the invoices, stock-list, customer data etc. And write a user manual for it.

3) Get down to work on the Music OCR package that Brian Becroft mentioned to me some time ago. ATM, about all it will do is read in an image file (in IMG format, I think) and display it on screen in a window.

3990. GDOS printers

Newsgroup: comp.sys.atari.programmer
Date: 2000-04-09 00:00:00 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <8cpc7mgru1@newshost.comnet.co.nz>
Source record: 2059

How does one determine the names/types of printers available under GDOS?

For example, I have two printers installed under GDOS (a 9-pin matrix and the SLM laser) . And I assume that I am not unique in this.

Obviously, I can walk through the range of GDOS printer ID numbers, and try to open a workstation for the device. That will tell me that there is *a* printer installed there, but not the *name* of the printer, so I can put up a menu of all the printers I find and get the user to select which one to use.

Or I can scan the ASSIGN.SYS file - but that only tells me the name of the driver file associated with the device number - which may not necessarily match that of the printer (I could easily rename one driver to "WL67J3.R9E", and as long as it is correcly named in the ASSIGN.SYS file, I am still none the wiser)

There doesn't appear to be a VDI/GDOS call that tells me this (according to the Compendium, and Hisofts "Modern Atari Software")

Well I have written a few programs for the Atari, most of which are available via my WWW page at http://gem.win.co.nz/mario/ . I have lately released into the public domain the source code to a number of those programs although this is not mentioned on my WWW page. However an archive is available on my FTP site with the source code.

My most recent software projects were three games which came 1st, 5th and 6th place in the recent Magic game competition. You can get these from my WWW page.

I am not doing any more Atari software development at the moment, instead I am working on a number of hardware projects, also mentioned on my WWW page.

Thanks to everyone who has replied. I did find the source I was looking for (Ernest Schreur's homepage). I have Atari programs on tape I want to make a permanent copy of. This technology actually also works for a number of programs I have on handheld devices of the past that used cassette players to save/play programs in Basic. Cassette tape is not a reliable medium. And believe it or not, some of those handhelds are still superior in raw programming capability and number crunching to the current wince lot.

Do they still call it that. I thought on windows at least people
just radomly slammed files together until something worked. Would explain
the file size and stability at least. ;)

As a programmer though I sometimes find myself wondering the
opposite question.

I'm a Win32 assembly coder right now and as far as I've heard, programmers seem to slack off on code optimization. Well, I'm not really that optimized of a coder either, but I'm trying :) I happen to also have an interest in the Atari ST.

If you've ever looked at the Win32 assembly world, that is one thing that we all complain about. You should see http://www.grc.com This guy really keeps his software small yet useful. There's also http://www.fastsoftware.com

How can I find out which process is currently "on top". I know
appl_search gives me all running processes, but it says nothing about
which one is on top. I have also looked through all of the Gemdos calls,
but found nothing there either. Any hints?

You could try:

wind_get(0,WF_TOP,&hdl,&owner,&below,&dummy)

This is AES 4

It would be nice, when there is no window open, to get at least the menubar owner.

Who knows?

menu_bar(0L, -1) will return the ap-id of the current owner of the menu
bar. The precesence of this feature can be checked via appl_getinfo(),
opcode 6. It works with MagiC as well, IIRC.

I've pondered the matter. I recall attempting all manner of methods. They all failed bar pug's current one - in that Gem would behave erratically (the older the version, the worse it was iirc) to a greater or lesser degree. Essentially it boiled down to the "connectivity" and "ownership" between the parent process's Gem arrays, and that of the overlay.

Sadly I haven't a single concrete example but things such as this would happen...

(1)
Messages would vanish: eg app under development would issue a redraw to an "overlay owned" window and it'd work (as it should). Suddenly, a week later, having added code, the app would break. Lots of debugging later and I'd discover said message would be vanishing into a black hole.

(2)
Program would suddenly hang/crash or simply ignore (some) interactions. Pug has "hooks" in it which allow an app to get involved with all the messages which pug handles automatically. One hook per automatic message. A hook is nothing more than a function pointer, default NULL, and therefore not jumped through by pug. Once an app shoves a value in there, pug starts jumping through it on receipt of said AES message, typically twice (once before pug handles it, once after pug has handled it).

This is a grand opportunity (scuse my french) for a ... big time f*ck up! Pug is already using the caller's stack (ie the app's) and now the app is piggy-backed on top of itself as it were. We could easily go spiralling out of control. Thus, whilst this kind of use is permitted, it is only documented as being useful for use by the app in situations where the odd global variable needs setting. The better solution is for the app's hook code, to tell pug not to handle the message. Pug then backs out of itself, right out into the applications "evnt_multi", where things can be dealt with in the usual manner.

Why am I explaining all this? Here's why...

During the course of development, of the "other methods"(*) tried, all showed erratic behaviour concerning the message origin. Pug doesn't have to handle all windows - an app might deal with its own entirely by itself. Yet, on occasion Pug would deliver such a message through one of its own hooks. Ditto the reverse, Pug would start passing back messages it ought to be handling. This behaviour had nothing whatsoever to do with Pug, after all - I could trap the raw AES messages, and they were just "quirky" (even appearing as owned by other programs - word processor, desktop etc). No wonder it crashed. Gawd knows who's resource file pug was getting access to!

In a nutshell, the problem was pug of course - but only in as far as initialisation was concerned. For all my mucking about I never had to change the pug code, just that darn "pugbind". Once you've got Gem to understand the two parts are one and the same thing (or two and separate) you're laughing. The most unfortunate thing though, is on occasion an initialisation problem can take weeks to show up.

(*)
Tried "hack 'n' slash" at the global[] array; also pug being the parent and loading the app; also straight "binary image".

> So when are you going to come back home and program some Atari
>stuff :)

I'd be tickled pink to have the chance to do *any* programming. Just too darned exhausted these days, same as yourself it seems. Just look how long it's taken me to reply here!

> Come on you know you want to do it!

Hehe! I have *tried* to get GCC working. Ignoring the above, for better or worse, I'm into C++ now. :-)

Hi Folks,

I've banged the lot on my website. Forgotten the url already. Go to homepage then click on [Atari][Programming][PUG]. Have also made a feeble attempt at documenting how it gets compiled.

Whilst the entire pug sources are there, the library sources upon which it depends are not. Will take me a while to figure that one out. Most likely I'll end up posting the sources for all my libraries.

Note:

Version 0.9 was an interim version which consisted of V0.8 unchanged; plus stuff I was working on for GFA users to be able to access pug data; plus a load of stuff for rendering fonts into OBJECT's (unfinished sadly); plus I ripped out most of the docs prior to a "release rewrite"; plus I stuffed in a slow but reliable high level memory manager (a kind of C++ 'container object') that was never meant to live there permanently; plus other bits I've long forgotten.

V0.8 would have made a better source code release but V0.8, along with lots of other sources, was stuck in one of a set of LZH archives which accidentally got password protected.

> > (Library lister, info viewer etc)

An AUTO folder program I started writing in 1992 to allow ST apps to load/unload libraries of useful code as and when needed.

Essentially it's a "DLL manager" for the ST.

As you can probably tell from the 1992 start date, I haven't exactly prioritised the development of it.

However, it does have quite a few features:

- Libraries can be loaded at boot time (by setting a "boot me" flag) if you want it to be loaded then.

- There are two types of library - system and user. System libs are essentially for system related tasks (drawing 3D objects, talking to hardware etc), whereas user libs are for user tasks (calculating profit margins, dithering an image, etc)

- Libraries are loadable by applications at any time.

- One can ask if a library is loaded, and link to it. (I still have to work on the code for when the app that loaded a library crashes, and another app is still using the lib)

- Libraries are essentially normal GEMDOS executables (unlike the special rigmarole you must go through to create a CPX [prepending a header])

- Library calls are similar to XBIOS/GEMDOS calls (placing data on the stack, then a function number and issuing a 68k TRAP instruction). However, one must also push a library handle onto the stack, and a magic number is placed in a register. AFAICT, it works OK under MiNT with memory protection activated(I've tried MiNT versions 1.04, 1.12, and 1.15 on my TOS 3.05 TT)

A sample session in C:
(I still need to work on this a bit, it doesn't feel quite "right", but
you should get the idea)

```
#include "0/tlbx.h"

int main( void )
{
TlbxInfo tlbxinfo;
TlbxLibInfo tli;
LibHandle lh;

// check if toolbox is available
if( xtlbxInfo( sizeof( tlbxinfo ), &tlbxinfo ) == 'tlbx' ) {
// check if library is available (normally one would load it if
it isn't)
if( lh = tlbxLibAvailable( LIBTYPE_USER, "Hello", sizeof(tli),
&tli ) ) {
// call a func within the library
helloFunc( ... );
}
}

return 0;
}
```

now the same thing in assembler:

```
main:
pea tlbxinfo
pea tlbxinfosize
move.w #'tb',-(sp)
trap #14
cmp.l #'tlbx',d0
addq.w #4+4,sp
bne notoolbox

pea tli
pea tlisize
pea libname
pea LIBTYPE_USER
pea (0<<16)|LibAvailableFuncNumber
move #TLBXMAGICNUMBER,d1
trap #0
move.w d0,d7
add.w #4*5,sp
blt libnotavailable

pea data
move.w #hellofuncnum,-(sp)
move.w d7,-(sp)
move #TLBXMAGICNUMBER,d1
trap #1
addq.w #2+2+4,sp
```

```
libnotavailable
notoolbox

moveq #0,d0
rts

DATA
libname
dc.b "Hello",0
even

BSS
tlbxinfo
ds.b tlbxinfosize

tli
ds.b tlisize

END
```

Whoops - this was for a very out-of-date version (and it wasn't the best
example either). Sorry.

Here is a better (albeit simple) example - a "Hello World" using a
loaded library (I wrote this while online [using SatanSoft's IE on the
PC], so please forgive any typos/style errors)

#include "0/tlbx.h" // Toolbox funcs and types
#include "0/types.h" // for "sint16"

#include <stdio.h> // for printf

int main( void )
{
TlbxInfo tlbxinfo; // info about the toolbox
sint16 libhandle; // library handle [negative = error]
TlbxLibInfo libinfo; // info about the loaded/linked-to library
sint16 loaded = 0; // "did we load this lib?' flag

if( xtlbxID( sizeof( tlbxinfo ), &tlbxinfo ) == '_tll' ) {
libhandle = tlbxLibAvailable( "Hello", sizeof( libinfo ),
&libinfo, LIBTYPE_ALL, 0 );
if( libhandle >= 0 )
libhandle = tlbxLibLink( libhandle );
else {
libhandle = tlbxLibLoad( "hello.tll", sizeof( libinfo ),
&libinfo );
loaded = 1;
}

if( libhandle >= 0 ) {
printf( "%s\n", helloString() ) ;

if( loaded )
tlbxLibUnload( libhandle, sizeof( libinfo ), &libinfo );
else
tlbxLibUnlink( libhandle, sizeof( libinfo ), &libinfo );
}
}

return 0;
}
```

(I'll not attempt to write an assembly-language version of this example - I wasn't thinking properly when I did so last night [the PC has that effect on you])

As you can see, it looks to see if the Toolbox is loaded. If so, it then uses it to look for the "Hello" library. If that library is loaded, it links to it, getting back a possibly different handle to it. If it wasn't already loaded, it loads it. If the handle was negative then the link/load failed. Otherwise we then call the "String" function within the library to get back a string to display via the C library call "printf". Then we either unload or unlink from the library as appropriate, and exit the program.

No - I haven't done any real Windows coding. Most of my programming has been on non-PCs over the last 15-odd years (much of which has been Q&D utils for the ST and TT).

I am, however, currently learning how to write Windows apps on a PC that was very kindly given to me, so I can take part in a potentially good moneymaking organisation writing Windows code for certain tasks.

(I am slowly working my way through an old copy of Petzold as part of my Windows learning process, finding the odd bug/inconsistency in the presented listings, and reorienting my brain from the higher-level and better organised GEM mindset to the "can't be bothered making the OS do this, so we'll make the apps do it instead" mindset that seems to crop up in Windows programs)

I have, however been reading a number of computer mags (most of which are now very PC-oriented) and took my inspiration on how to write the Toolbox from some of the articles and listings therein.

I also used a few of my own needs/wants when writing it.

Why not just compile it, load it into memory, relocate it using the
relocation table, and then save the result?

Ciao

Thomas

4025. More processes under Magic

Newsgroup: comp.sys.atari.programmer
Date: 2000-04-27 00:00:00 UTC
From: Henrik Gildå <di98gihe@chl.chalmers.se>
Message-ID: <39084FB9.EE2C8F@dtek.chalmers.se>
Source record: 2094

Thanks for the information I got under "Processes under Magic", it was very useful! Since then two new problems have come up:

1) I use appl_search() to get all the running processes, but when one of them gets 'frozen', it can no longer be found with appl_search(). I have downloaded the latest online Magic programmer documentation, but haven't found anything in there either.

2) I need to know the amount of memory a process uses. Prusage() should do it, but it only seems to work under MiNT. I haven't been able to find any other system call in the Magic programmer docs either.

Thanks for any help.

Regards,
Torbjï¿½rn Gildï¿½

Look at the size of the process' entry in u:\proc (if MagiC has this).

What you need to do is modify and re-assemble PCSTART.S in the LIB
folder. Pure Assembler DOES support absolute addresses.

Actually, all you have to do is set the absolute addresses under the
Options/Linker dialogue. This will also create an absolute address
executable header.

(I forgot about that earlier.)

Yes, from TOS 2.0x and upwards it's possible to remap these keys, but I
haven't seen it officially documented anywhere. I believe it was discussed
on the MiNT-list quite some time ago, so if you search the archive I think
you'll find it.

May I ask where I can find this archive? (I even didn't know such a thing existed...) Or best, if you know the way, why don't you just let us know. (It's late at night... or early in the morning... and I feel lazy.) ;-)

I don't mind if it's not "officially" documented; all I want to know is if it works on my Hades, in order to finish remapping all the keys to what's written on that PC keyboard. (I'm tired to remember how Atari keyboards are mapped.)

See you later,

On Fri, Jun 19, 1998 at 07:22:20PM +0100, Petr Stehlik wrote:
> No, the Alt combinations are handled by TOS and are hardcoded, AFAIK.
> You would have to write a completely new keyboard driver.

Only up to TOS 2.06.

"New code as of 5/92: in the all-countries cases (TT, SPARROW) we use
the new variables salttran/saltshif/saltcl as associative lookup tables
instead of doing the alt-key translation job in code."

Keytbl (XBIOS 16) returns the pointer to the KEYTAB struct. In newer TOS
versions, these consist of:
- unshift table
- shift table
- CTRL table
- unshifted ALT table
- shifted ALT-Table
- capslock ALT-table

The new tables consist of scancode, ASCII code pairs, terminated by a zero
scancode.

I am not sure if this was documented by Atari (I don't have a compendium
here), and if you should use this feature to load new keytables - but I do
not see much danger in using it as long as you are sure that the TOS
version
you are on does have these tables. It definitely is much easier than
writing
a whole new keyboard driver.

So do I, understanding this encrypted message. If your posting links to pirated material, I doubt you have much to worry about. See, there has been this revolution called Windows. Everyone is using it, I hear, so it pretty much makes the Atari market open to the few that have fond memories of the platform. Heck, if anyone is still looking to purchase Atari software, I think your honesty is admirable, but I'm sure they guy who has programmed it is now making his money elsewhere and could care less. If he does care, I can point him to a support group of Vic20, TI99a, and Adam programmers. ;-)

4048. Help needed with GCC & make

Newsgroup: comp.sys.atari.programmer
Date: 2000-05-25 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <392CD088.C960BA97@siemens.at>
Source record: 1967

Hi,

I've been working some time on the asm part of the A800 emulator for
the Falcon. The common part is in Gnu C.
Since I couldn't get 'make' to work with the 'Makefile', until now I
always compiled the modules with single commands, but with every new
A800 version this means a whole evening of typing a command every
two minutes and I'm getting tired of that. So yesterday I tried
'make' again after installing GCC 2.95.2. BTW the environment is
mint 1.15.5 and n.aes 2.0. 'make' said it doesn't know 'rm' and
'echo' and if I deleted these from the Makefile I'm sure other
problems would be popping up.
So can anybody tell me what I did wrong or where I could find a FAQ
or some description what I have to do to make 'make' work propperly ?

Gerhard

Hello Gerhard

> 'make' said it doesn't know 'rm' and 'echo'
I think you should either set the environment variable SHELL to the path
and name of a shell that can interpret the rm and echo command or add a
line to the Makefile that looks like the following one:
SHELL=C:\GEMINI2\MUPFEL\MUPFEL.TOS
where 'C:\GEMINI2\MUPFEL\MUPFEL.TOS' is the shell that I am using under
MagiC. In your case you would probably use '/bin/sh' or something like
that.
BTW: some versions of make try '/bin/sh' as default if SHELL is not set.

Hoffentlich hilft dir das was.

Greetings,
Daniel

GNU Makefiles often use tools that are part of the Unix system. As you
doesn't have installed these tools the Makefiles don't work.

Just install the bash, fileutils, shellutils and try again.

Tschuess

Thanks.

I use to before I change my name from Paul Michael Glaser to just Michael Glaser. Ah, those were the days. David (Soul) and I still keep in touch but I haven't seen Antonio Vargas(Huggy Bear) in about 10 years. The last thing I heard he did was "I'm Gunna Get You Sucka". He played the most believable pimp. A true pimp artist.
I quit acting soon after my wife and child died from AIDS. Now I just keep busy doing charity events and working on my Atari Falcon.

I was looking more for Assembler or C(or better yet, C++) stuff. I've come across a couple of things, but the GNI C++ really made my ears perk up. For one thing, I didn't know C++ was available for the Atari.
A friend of mine use to love GFA basic. Is it much like Visual Basic? How fast is it?

Since my days with the Atari ended when the Falcon came out, I'm still pretty "stupid" as to the "real meat" of MiNT, but after revisiting GEM, I see a real need for some improvments. I'm sure that has allot to do with the fact that I've been snuggling with Windows with so many years, but the left mouse button is greatly unused.
I've been going over my book, so I'm sure I'l be a little more knowledgable in a bit.
Now I just need a project to work on.

NO!!
The newest version of GFA is from 89. It uses some routines that don't work anymore and you have to rewrite them (Fileselect). Its user interface is, erm, quite unique. It uses no GEM, otherwise-unheard-of hotkey-combinations, has a weird old-fashioned screen. It doesn't work with MagiC, screenblasters, graphiccards.
BUT it has a heuuge (in Atari terms) following of fans who have grown up with it. A load of people have written patches (to make it work under MagiCMac e.g) and it's very easy to find help on the net.

Try info@mucs.com, they have it in their ads. If you read german, you can buy a package consisting of the CD and two books, one of them quite easy to work with if you mean to program under GEM. The other one is by Ostrowski himself, but it was too high for me.

It's not really like Visual Basic. You can try faceValue, which
claims to make gfabasic feel like visual basic, but it's really
just a collection of canned code for windows and menus and such.

Speedwise it's ok for most tasks, depends on what you want to do
I guess. It does have limits.

For more info on gfabasic have a look at my web page as I'm
still a fan of gfabasic.

In combination with the add on Face Value YES!

You simply let your code react on events from the Face Value engine and
all "low level" GEM handling of the user interface is taken care of
automatically.

4063. Keyboard nationality info

Newsgroup: comp.sys.atari.programmer
Date: 2000-05-28 00:00:00 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <8gre1h$c9t$1@plutonium.compulink.co.uk>
Source record: 1982

I would be interested in hearing from people with non-British keyboards
what value their _AKP cookie reports. Even more useful would be reports
from people whose keyboard and TOS are of different nationalities.
Please give the machine and TOS version in each case.

The cookie value may be established from the COKKIES.CPX by Dieter
Fiebelkorn, or one of the system testers mentioned below.

The reason for the enquiry is the discrepancies between Mark Baines's
PROFILE2.PRG as compared to other similar testers on the keyboard
nationality of my British Falcon. This reports:

Keyboard nationality and language: United Kingdom and English

and in the cookies list:
_AKP $00000003 3

All the other testers give the same cookie value, but interpret the
keyboard and/or TOS nationality as USA.

Thus in Christophe Boyanique's Sha'uri, in Cookies listing:

_AKP $5F414B50 ($00000003)
Keyboard language: USA
TOS language: UK

But it also reports in Non-Volatile RAM listing:
TOS language: USA
Keyboard language: UK

Sysinfo2 by David Troy from Toad computers reports:

TOS Country: USA

and in the Cookies list again:
0x5f414b50 (_AKP) 0x00000003

SysInfo V4.80b by Thorsten Bergner reports in System:

Country : GBR

and in Non-Volatile Memory
Keyboard : GBR
Language : GBR

but in Cookie list:
_AKP 3 Keyb. : USA / Country : GBR

Now the 'Atari Compendium' states for the _AKP cookie:
'...The high word of this cookie is currently reserved. The low word
indicates the language currently used by TOS for keyboard interpretation
and alerts. See the explanation for the country code in the OS header
earlier in this chapter for valid values.'

That section lists the os_conf and countries (0 = USA ... 3 =UK ...) and
adds 'As of TOS 4.0 the OS is compiled with text for all languages and
switches between them based on the country code stored in non-volatile
RAM. Use the _AKP cookie to determine the actual language in use.'

There seems to be nothing explicit there about using different parts of
the value for keyboard and TOS nationality.

On the other hand Zorro's TOS.HYP states, in translation:

_AKP Keyboard layout and national language
The Cookie gives info about the language and the keyboard
layout of the system. Bits 0-7 inform about the language:

0 = USA
...
3 = England
...

Bits 8-15 identify the layout of the keyboard

followed by the same table.

Sha'uri too uses a similar explanation of the cookie:

_AKP Advanced Keyboard Processor
high word reserved
very low word: keyboard
low word: TOS language

and may have got it from the same source.

It is possible, I guess, that the above applies to pre-TOS 4.xx
machines. I am told by a German user that his machine returns $00000101
but I am not sure which TOS he is running.

Thanks for your help!

Regards, /Peter/

Frank Naumann wrote:
> Just install the bash, fileutils, shellutils and try again.

I first tried rpm (although I don't find the concept very convinient,
I don't see any advantage compared to tgz files) but rpm complained
about not finding rpmsh (or something like that), probably caused
by some missing symbolic links (I did see the file it complained
about). So I couldn't depack any of those rpm packages.
Next try was to free an additional partition and let KGMD install
itself there. Then I copied everything useful from there to my
/usr/bin. Now, as long as I'm in /usr/bin bash understands all the
commands, but that ends after the first cd command. Probably another
case of missing symbolic links ? Or something missing in mint.cnf ?

Hmmm, well then, I think I'll stick with Assemble and C. It's been a few
years since I've messed with both of those languages, but I know I can
remember 68000 assembler after a few moments and C, well, a couple of
refresher courses and I'll be back to normal.
I've got The Atari Compendium as well as several other book(Yes, even the
cryptic Abacus collections). They should get me going.

Thanks,

Hello!

> /usr/bin. Now, as long as I'm in /usr/bin bash understands all the
> commands, but that ends after the first cd command. Probably another
> case of missing symbolic links ? Or something missing in mint.cnf ?

Do you have linked /usr/bin to /bin? You can do this with these statements
in your MiNT.CNF:

```
sln #:\bin u:\usr\bin
sln #:\etc u:\etc
sln #:\home u:\home
sln #:\tmp u:\tmp
sln #:\usr u:\usr
sln #:\var u:\var
```

With # as your drive letter. And don't forget to setup a correct
environment ($PATH, $HOME, and so on). For this best look into the KGMD
documentation and the configuration sample files.

Tschuess

4067. Re: Keyboard nationality info

Newsgroup: comp.sys.atari.programmer
Date: 2000-05-29 00:00:00 UTC
From: Pascal Ricard <paricard@free.fr>
Message-ID: <39325112f246f9@free.fr>
Source record: 1986

Hello,

in article <8gre1h$c9t$1@plutonium.compulink.co.uk> (comp.sys.atari.programmer)
xlator@cix.compulink.co.uk wrote on Sun 28-05-2000 15:29 (GMT):

> I would be interested in hearing from people with non-British keyboards
> what value their _AKP cookie reports. Even more useful would be reports
> from people whose keyboard and TOS are of different nationalities.
> Please give the machine and TOS version in each case.

My Falcon (french machine/keyboard) reports _AKP $00000202 but I thinks
it directly related to the NVRAM setting. My TT (tos 3.06) do not have
the _AKP cookie.

I used this information to hack an _AKP cookie for Magic to try to make
HD-Driver, Bootconf, etc., "speak" English in Magic 6.10 (german
version): no luck.

My reference is the Compendium (paper edition).

Bye,
/Pascal/

Hi

There are some commercial packages knocking around. The best are Devpac
for Assembler, although I think most people use v2 the latest is v3,
and Lattice C v5.6 both from HiSoft.

I do have a copy of Devpac 3 spare and Lattice C 5.6,
coincidentally:)))))

Haha, coincidentally I just got a hold of those same programs. Originally,
I knew they were one of the last development packages to be released for the
Atari, but I was having a hard time finding them. I have an older version
of both that I purchased years ago, but I wanted a more up-to-date release
so I can support the whole Atari line.
I'd be nice if I could do the development on my PC, but it seems PacifiST
and they other emulators out there only support TOS version around 2.06(I
noticed a French version that was 3.01).
Either way, I will create at least one useful tool on my Falcon.

If you have any other tools you think might be useful, please fill me in.
Like I said, it's been so long since I've been on my Atari, that I'm really
out of touch.

Thanks,

Hi

PacifiST SHOULD support whatever TOS image you are using... When I
tested it out, many moons ago, I ran it with 1.6, 1.62 and 2.05!!! You
just need the TOS images.

There is other utilities you can aid programming, but most of the ones
(if not all of the hardware ones) run on pre TOS 2.06...

When using Newsie v96 under mintnet,newsie will exit and I get the message
pid 129 (newsie) bus error user pc=ffff001c address:69b190 (basepage=66ac60)

I have received the same with latest beta kernal of mint.I am now using mint
1.15.1 (falcon 030).

I connect with pppd 2.20.

If you know assembler and "C" already I would say stick to those.
Although I'm hooked on gfa myself, gfa does not give you much
control over a project. Happying coding... ;-)

Hi Mike

I'm no mintnet expert, but if you don't have Gluestik you should
get that if you want to use programs that are programmed for the
Sting/Stik API.

Hi Michael!

I get that too under Sting/MagiC 6! Also my Falcon doesn't like the
sub-menus, where the machine just freezes if I try them.

Also I get a crash when I try to download mail!!! :(

I reported these problems to John Rojewski, whilst v0.96 was in beta, but
they don't seem to have been fixed for the full release.

It's too bad. I've had to go back to using v0.94. :(

Cheers!

I was trying to be nice to newsie, but obviously you've never
tried it? Relatively speaking PINE handles news way better
than newsie. If PINE is horrible then newsie is what?? ;-)))

> don't forget to use the correct syntax ('setenv' is a csh command).

And for those not knowing the right syntax for bash:

export PATH="enter-path-here"

Note that this will not work with a simple sh, so in /etc/profile,
better use the split-up form which is understood by all sh-style shells:

PATH="enter-path-here"; export PATH

Ciao

Thomas

I think I located my main problem, untortunately without knowing
a solution. I have included above mentioned links in mint.cnf
(and mintnaes.cnf since that seems to be copied to mint.cnf when
using n.aes) and I changed $PATH to include /usr/bin but when after
rebooting I activate bash and say 'echo $PATH' /usr/bin is not in
the list. There is no 'setenv' for PATH in bashrc (or bash.rc).
So I don't know where the wrong PATH can come from. Any idea ?

BTW, thanks for the other tips until now. At least I feel I'm near
to the goal now.

Gerhard

I got all the needed utilities by installing KGMD on a spare
partition and then copying everything missing from there.
The 'professional' way would have been to get the rpm packages
from the sparemint page and install them using rpm but when I
tried that I got an error that rpm doesn't find rpmrc (although
it was there) while the KGMD installation worked without
problems. So, looking back, I think the best way is starting with
installing KGMD (or KEMD since it's a bit newer).
Then you have an old but complete system.
Afterwards you can put GCC 2.8.1 or 2.95.2 (and whatever else you
need and can get) on top of it.

Gerhard

No, the naes.cnf is a completly different hing. Best delete $PATH from
naes.cnf and set it only in MiNT.cnf.

> and I changed $PATH to include /usr/bin but when after

For bash you can use the global configuration file /etc/profile. And
don't forget to use the correct syntax ('setenv' is a csh command).

Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi all,

For some odd reason, I decided to fire up my ST and finish writing a game I wrote starting in '96. Well, my old ST isn't what it used to be, so I need to finish the game on GEMulator. Problem is: My ST's floppy drive (actually the sound chip/floppy controller) is whacked and I can't copy STOS from the hard drive to my PC. I have the original disks, but two of them (games and accessories) will not read in my floppy drive.

Anyway, does anyone know where I can get a copy of these two disks on the internet?

Also, has anyone else tried STOS using GEMulator98? My mouse doesn't want to work, which makes it a real bear to load a file into it.

Thanks,

--
Greg

Hi!

You should be able to find it somewhere, I believe STOS is now freeware, at
least the sourcecode for STOS itself is..

/Peter

Of course if you wanted to you could just replace the drive in the ST.
Any drive will work. Just have to change the jumpers in the back.
Doesn't matter if it says "PC Drive" on the box. Or you could d/l a
program called PARCP. This allows transfer of files from ST-ST, ST-PC
or PC-PC by using the parallel ports. You just to have order or build
the special cable. I did that and it works great.

Nope, I tried replacing the drive a while back. That's why I'm convinced it's the floppy controller/sound chip. Sometimes it works, sometimes it doesn't.

That sounds like an idea. Either that or little null-modem action with ST Serial to PC Serial.

I'd still like to find replacement disks for STOS if anyone knows where they are.

Thanks,

4091. Pure Pascal 2 GEM

Newsgroup: comp.sys.atari.programmer
Date: 2000-06-04 00:00:00 UTC
From: Claus Rogge <rogge.claus@aon.at>
Message-ID: <960102802-463681AEicMi@aon.at>
Source record: 1910

Hello everyone,

Im trying to write GEM programs in Pure Pascal and having trouble even with the dialogue-box example in the manual. Im a newbie to programming and doing it on a hobby basis, so please try to speak veery sloowly and use easy-to-understand words.:-)

This program - its called HANDLE_F.PAS and the listing is in the manual to copy and learn from; yes thats how far Ive got - I ahve lefte out big chunks of the listing and only left those that I think are in connection with the problem

```
program xxx;
uses geminit,gem;
...
var
tree : AesTreePtr;
...
rsrc_gaddr(R_TREE,TREE1,tree);
```

and this is the point where the debugger (sometimes I feel like leaving out the "de") says:
ERROR: Types of actual and formal var parameters must be identical.

Since the "tree" Pointer is the only var-parameter of this function I think this must be the problem. I have tried to move the .RSC file around on the HardDisc but that sems not to be the problem.
geminit.PPU is one that i wrote off a listing in the manual as well. It works with the other
program (MYFIRSTGEM.PAS or something).

Ive been stuck here for a few weeks. If anybody has any hints as to where my stupidity lies,
I would be very thankful.

Gregory George wrote:

> Anyway, does anyone know where I can get a copy of these two disks on
> the internet?

Well, I managed to get STOS off of my ST. I was expecting more trouble out of the floppy than I actually got. I've also put it on my web space in case anyone else needs it. Compiler included.
http://home.att.net/~greggeorge/stos.zip

BTW, one of the extentions I've got in there (not sure which) would hose up GEMulator.

Has anyone seen a case where the ST works for the most part, but goes flaky just in some cases? In my STOS program, I am 100% sure certain screens were working perfectly when I originally wrote the program. And they work fine when I run the game on an emulator. But on the real ST, some screens are totally whacked. Any ideas why this would happen? Could it be a memory problem?

Thanks,

--

Nice to see a .sig with HiSoft in the content after so long. I think peop's could be forgiven for forgetting you even existed, you dont go out of your way to publicise yourselves in Atari world anymore.

Whilst your here, what if anything does HiSoft offer for the Atari now. I see that Papyrus 8 is now available, and as this was one of your higher priority products i'm suprised your not handling it now?. I'd have been one of the first to upgrade it via yourselves as i did with every other pap version!.

You were one of the highest profile names in our scene with IMO /the/ best deveopment packages available, all of which i bought from you, give us something to make us think HiSoft next time we have some money to spare.

I was wondering what happened to
the FORTH programming language
for the Atari 8-Bit Computers?

It was supposed to be a free-wheeling
user friendly language, but I cannot
find myself a copy for either my
Atari 800XL computer or my
"Atari800Win" emulator.

I have Atari Basic and Mac65 for
the XL, also have Atari Basic and
Atari Asm/Ed for the emu.

>
> PATH="enter-path-here"; export PATH

Many thanks since at least I was one of those not knowing the
right syntax :-)

Now if I enter the 'export PATH' in bash then it works. Before that
the value of path is wrong. I even tried links from /etc/bashrc and
/etc/bash.rc to /etc/profile. But anyway since everything works
after entering a single command in bash I can live with that.

Another thing I was wondering about is whether it's normal that
bash (I use 2.0.2) is loosing characters at input. There is no other
application where I have these troubles so it can't be my keyboard.

4098. Atari XL cardridges secam/pal/ntsc ?!?

Newsgroup: comp.sys.atari.programmer
Date: 2000-06-05 00:00:00 UTC
From: ficsx22 <ficsx22@caramail.com>
Message-ID: <393BE500.B1E0314D@caramail.com>
Source record: 1917

Hi there !

I have a question about the possibility to use american cardriges on
europeans Atari computers.
I own an Atari 800XL Secam (french system) since 1984.
I recently bought an Atari 800XL Pal.
I had a lot of cardriges and, without thinking twice, I used them on
both system, and didn't notice any problem.
A couple of days ago, I found a shop in the USA, selling Atari
cardridges at a low price. It sounds really interresting.

But a friend of mine told me that I would certainly be unable to use
these cardridges on my european computers.
In fact, the cardridge would run but the image wouldn't display.
But I do wonder if the cardridges are linked/bound to a video system.
Aren't these cardriges supposed to work internationnaly ?
If not, how come that I can use my french cardridges on my pal computer
?

Furthermore, I've just bought a french (but Pal) Atari 7800.
And I have the same problem: can I buy american cardriges for that
computer ?

I thank you a lot for having the patience to read me entirely.
I hope this trivial/simple/easy question won't bore you.
But I'm really longing to buy some new cardridges and an answer would be
appreciated.

Thanks in advance.
Laurent (ficsx22@caramail.com)

Source record: 1918

Hello Henk

>Show us the formal definition of this 'rsrc_gaddr'

OK, hoping I have understood rightly Ill try.
rsrc_gaddr is the AES system call that gets the adress of the .RSC file.

Its syntax is

function rsrc_gaddr(re_gtype, re_gindex : Integer; var re_gaddr : Pointer) : Integer;

with a number of possibilities for the type (R_TREE, R_OBJ or TEDINFO and BTBLK(or whatever))and index (the name) of the object. The adress is a variable (in my example, tree) that this function writes the found address into.
The syntax is exactly the same in C, Basic and every other language since its an AES-system call. At least thats what I think, Ive read through a book on GEM programming that dealt with C and Assembler only and they used the same words.

Hallo Claus

Claus Rogge wrote:

> function rsrc_gaddr(re_gtype, re_gindex : Integer; var re_gaddr : Pointer) : Integer;
>

O.K.
'var re_gaddr : Pointer' is the formal parameter declaration.
This is what you declared as actual parameter:

var
tree : AesTreePtr;

Now you must find out where 'Pointer' and 'AesTreePointer' are declared and see
what the differences are.

Note: In C rsrc_gaddr needs the address of the pointer, not the pointer itself.

I am NOT a Pascal expert, so I can not go into details, I just use general
knowledge.

Err.. that's not quite right.

It gets the address of an OBJECT/TEDINFO that has been loaded into
memory.

It does not get the address of the file.

Hi

There may be a problem with these carts from the USA as they use a
different TV system to our PAL. Cartridges and systems that run in
Europe etc. shouldn't be too much of a problem .

Saying that, I have a couple of 2600 carts from the USA and I can use
them on my UK 2600 without a problem, but they may not work 100% on an
old tv.

No matter which one I choose I will receive about 26 bytes and then it's
off to timeout 1,2,3.. and so on

I seem to have some luck when pressing the esc key but most of the time
most of the page is not loaded properly.

Should I just wait it out and hope for the best.

I have version 18404

When I try to dial with the latest pppd dialer
(ppp 2.3.11).I keep getting some message about not being authorized
then an ip address is shown and then the progrem will disconnect[D[D[D

Any help ?
Thanks

Add a line with the word "noauth" to one of the option-files.

I wonder if you know how I can prevent that the log is written to the
console. With the previous pppd every log was written to \var\log\ppp-log
and \var\adm\messages but now with the latest pppd a part of the log
appears on console too

```
Serial connection established.
Using interface ppp0

I guess that's something you configure in syslog.conf. I've always
prefered direct output (I'm a control-freak, besides I don't like
log-files which tends to grow into the sky over time) so I haven't noticed
any difference. I suggest you examine the man-file.

Those aren't bad deals but since the Atari is pretty much a garage sale item these days, the software comes cheap to free. Hunting it down is the hard part. I'll keep your bargans in mind if there is something I can't find at a local flea market.

I've been working with Pure Pascal for as long as it exists and
I think it's the most user friendly and yet powerful programming
environment on the market. Since I never tried the examples and
rather implement 'sensitive areas' myself and not use RCS I thought
I'd let someone more experienced answer.
But since nobody did, I'll try to look at your problem but it may
take a few days 'til I find the time to do it.
BTW, just to be sure I look at the same thing, what version of Pure
Pascal are you using ?

Gerhard

Okay. So everything should be comparable.

And now the part where I will sound like a teacher but if you read it
to the end I hope you will have a bit less troubles in the future.

The error you encountered is not generated by the debugger but by
the compiler. The reason why that is important is because at that
time no executable code has been generated yet. Therefore e.g. moving
the .RCS file could have no effect (since the program that reads it
does not yet exist).

Short excursion, done veery sloowly ;-)
Step 1 : the compiler checks the syntax. In case of errors the
processing is terminated, otherwise the source is compiled.
Step 2 : the linker puts it together with the other modules and
creates an executable program.
Step 3 : you can start your program :)
Step 4 (if it didn't work) : you trace through your program step
by step checking contents of variables and so on, hopefully finding
out what's wrong (= debugging)

And now back to your problem. Since you typed in the program from
the manual (instead of using the source file on the disk at path
DEMO_HB/KAPITEL2/HNDLFORM.PAS which would have worked) you
also typed the statement that is wrong in the manual :

```
var
tree : AesTreePtr;
```

which should be

```
tree : Pointer;
```

as it reads in the demo on the disk. If you change that single
statement the program will work (if there are no other errors
in the manual, I didn't check that).

Pascal does very restrictive type checks (and runtime checks,
and ...) and that is one of the reasons I prefer it compared to C.

BTW, somewhere in the appendices of the manual there are hidden
better descriptions of all the compiler and runtime errors.

Since you seemed a bit unhappy with your purchase let me tell you again that if something is bad then it's the manual and not the product. I think over the years I found three errors. Two of them were in 1.0 where they sent me corrections immediately after I contacted the hotline and the other one is still there in 1.1 but it's a runtime problem that occurs only in a very special and complicated situation and I've not been able to send them a demo program with less then 5000 LOC where it occured and they don't look at such big code parts. So I had to code a few lines a bit different and it worked. Anyway it's a very stable and reliable product and produces quite good and fast code and it's module concept and programming environment are better than at the other programming environments I know on the atari.

Hi Gerhard!

> (instead of using the source file on the disk
They seem to have cut down the number of files on their disks. I had to get some other example program that was not listed in the manual by mail. And this one wasnt on the disk either!

> the statement that is wrong in the manual
I had a suspicion that there was som error in the manual!!!

> in the appendices of the manual
I think you must have a completely different manual from mine. I got a 58 page A5-booklet,

the appendix is 2 pages and four lines.

>Since you seemed a bit unhappy with your purchase
Oh no! Not at all! The ":-(" was directed towards the fact that this version 1.1 will be the
last one for all times.

Hey, thanks a lot! Ill try it right away.

Bit later - Hey, it works - the program compiles without any error, but nothing happens. Is it possible that the listing in the manual is not complete? Ill keep on trying

I guess Im probably too stupid for this stuff anyway

> I've not been able to send them a demo
>program with less then 5000 LOC
Good to get tips from the profs:-)

So if you can't find an old demo version that includes those files
maybe I should mail them to you as a zip file ?

> I think you must have a completely different manual from mine. I got a 58 page
A5-booklet,
>
> the appendix is 2 pages and four lines.

That's a shame. My manual certainly has more pages, is not A5 and IIRC
each of the several appendices is much longer than two pages.

> Bit later - Hey, it works - the program compiles without any error, but nothing happens.
Is
> it possible that the listing in the manual is not complete? Ill keep on trying

Shouldn't be compilabe if it were not complete. Maybe it would be
best if you tried 'run' or 'debug' instead of 'make'. 'run' would
execute the program immediately after compiling it while 'debug'
after compilation would wait at the first instruction so you could
step through the program line by line looking what it does.

> I guess Im probably too stupid for this stuff anyway

Most things look complicated until you got used to them. When I think
back to my first hour of assembler training, I suspected I'd never
be able to write a whole program in assembler :)

Gerhard

Hi Gerhard

>So if you can't find an old demo version that includes those files
>maybe I should mail them to you as a zip file ?
Sounds great:-)

In my manual, the "Crash-kurs" is built around the following programs.
HELLO.PAS (bit obvious)
B_P_TEST.PAS (dealing with breakpoints)
LOTTO.PAS - not on the disc but listing complete in manual
STACK.PAS - I didnt get that one on my disc
OOPDEMO2.PAS - I got it on request, but overlooked the previous one
After that, the GEM programs start
EYES.PAS
HANDLE_FORM.PAS - the one in question! It was not on my disc
MINESWEEPER
There are some programs on the disc (in DEMO/) called TETRAX, WURMIE, UHR. But when I look at them I get the feeling Id better get started with something simpler

Ill try to find an old manual as well.

Greetings

4123. GNU C 2.95.2 Question

Newsgroup: comp.sys.atari.programmer
Date: 2000-06-14 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <39475812.F1527BDD@siemens.at>
Source record: 1942

Hi,

I recently installed GNU C 2.95.2 on my Falcon. The problem is,
this version doesn't seem to like the character \ e.g. at the end
of a line of a multi line macro definition. With older versions
(2.8.1) the code was compiled, 2.95.2 says something about a
'stray character \ in line xxx'.

Any ideas whether it's the compiler or my environment or something
else ?

thanks
Gerhard

Check if the file you're using ends its lines with CRLF or only LF. A
'\' must be the last character on the line, before the end-of-line
character, and if the file has CRLF at the end, and the compiler
expects it to be only LF, it might give an error.

Tomas

Since I got the source code file from another guy who can compile
it I don't think that's the problem but I'll check it this evening
to be sure.
BTW he uses 2.91.66 and said he will try to install 2.95.2 too
to check if he gets the same problems then.

thanks
Gerhard

This sounds like the source files have atari-lineends (CR/LF), while gcc
only works with Unix lineends (LF). Try loading the sources into GED or
Everest and resave with Unix lineends...

Strip the ATARI cr from your src files. Otherwise the preprocessor don't
work correctly.

Sorry to have bothered you all. I did change several files then and
this was the one I forgot to strip of the CRs :(

Although it would really be nice if it understood both line end
types.

> If I understand it right then AES terminates all processes (=also
> accessories) before it makes the resolution change. Is there any GEMish
> way of detecting the coming termination? I am asking because I need to
> do some clean up before the acc is killed and then (after the
> resolution is changed) loaded second time.
IIRC an AC_CLOSE message is sent before accessory termination. However for
pre-3.00 TOSes memory allocated "by the accessory" (in fact wrongly and
automatically associated by GEMDOS with the at-that-time active application)
may have been already unallocated... so on these TOSes the only way to cope
with this AFAIK is to patch the _p_run variable...
Oh and I think (correct me please if I am wrong) that accessoiries never
get AP_TERM messages.

4139. devpac and ext2fs/minixfs

Newsgroup: comp.sys.atari.programmer
Date: 2000-06-19 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <394DD4B0.ECBF3EEC@siemens.at>
Source record: 1858

Hi,

In case anybody else had similar problems and didn't find what's
wrong :

Last weekend I tried to use devpac3.10 on files that are on a ext2fs
partition. When it tried it via command line I got errors from devpac
that it can't find include files. Then I tried it from the devpac
shell and couldn't even load the source file.
When I copied the sources to a minixfs partition and tried it there
everything worked.

Gerhard

4140. Atari800 emulator

That's because ext2fs doesn't support the old API, it will only work with
MiNT/MagiC-aware programs.

Well I did not compile the source, but used the program for the TOS computers on my Hades. Actually it runs well and plays just like an eight bit computer as far as graphics and speed. The thing where it falls short is the sound, but it is not the program's fault. The Hades does not have DMA sound, but uses the same soundchip as a ST. I know, kind of dumb.

4145. Assembler and GNU

Newsgroup: comp.sys.atari.programmer
Date: 2000-06-21 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <39507FA0.60DBA6AE@siemens.at>
Source record: 1864

Hi,

Some questions :

- I sometimes use devpac and gst2gcc to create .o files to be linked
with gnu object files. Is this still possible with 2.95.2 ?

- I heard rumours that FreeMiNT uses 'something' that allows one to
write code for gas in devpac-like syntax. Does anybody know about
that or any similar tool and where to find them ?

- And slightly out of topic : is there any way to depack .rpm without
using rpm (in my MiNT/N.AES environment I have troubles to get rpm
to work) ?

Thanks for any suggestion
Gerhard

I think so, the object format is unchanged.

> - I heard rumours that FreeMiNT uses 'something' that allows one to
> write code for gas in devpac-like syntax. Does anybody know about

That's nothing special. The GNU assembler from binutils 2.9.1 understand
Motorola systax very well.

> - And slightly out of topic : is there any way to depack .rpm without
> using rpm (in my MiNT/N.AES environment I have troubles to get rpm
> to work) ?

The gcc, binutils and all tool + libs are available as tar.gz too. Or use
rpm2cpio to create a cpio archive. That you can unpack with cpio.

That would be `asmtrans' from the (Free)MiNT sources. It's a simple
lex/yacc-based preprocessor for assembler source files, which allows for
conditionals (like #ifdef in C) and is able to produce gas and pasm
syntax (at least, maybe some other formats as well).

Ciao

Thomas

Maybe nothing special but since I didn't know it (I only looked
at the syntax the compiler produces and didn't want to code in
that one) it's nevertheless great news for me :)

> The gcc, binutils and all tool + libs are available as tar.gz too. Or use

The compiler generate MIT syntax that is in fact not very readable :-)

4152. Sort of OT: Newbie Tech HELP! Atari 410 Program Recorder

Newsgroup: comp.sys.atari.programmer
Date: 2000-06-21 00:00:00 UTC
From: pengo35@aol.com
Message-ID: <20000621124732.18765.00000223@ng-bk1.aol.com>
Source record: 1871

Hello! I am looking for help w/ my Atari 410 program recorder. It would not run & upon opening it up I discovered that the large drive band had snapped. I had a similar sized rubber band that I thought would do the trick, and it does allow me to FF and rewind, but it will not PLAY--The left wheel feeds, but the right wheel does not collect the tape. Any suggestions out there?? Is it possible the band is not tight/thick enough to work?? Or is there something I am overlooking?? Thanks!

Dan

4153. Malloc possible in AUTO-programs ?

In casstte recorders usually the belt doesn't go round one pulley but
loops around 3 (or even 4). Not having one of these 410 recorder I
can't check where the band goes but I hope this helps.

Well I forgot to mention I also made a 'cp'/'copy'-like program that does
work... Only the 'mkdir'-clone fails... Very strange.

BTW Frank, are background-DMA tranfers planned in the next FreeMiNT stable
release ? (1.15.10 ? 1.16.0 ?)
And thanks for your reponsiveness !

There are a few caveats.

1. Don't do to many. On older machines the number of Mallocs
that you can do at any one time is limited. But using 1 should not be a
serious concern.

2. Mxalloc. I could be wrong but I think there is at least one
card that added fast ram to a system that needed a driver in the auto
folder. I can't remember what this was now. But in that case it should
still just be a location of your program after the driver.

Well, it had to come to an end someday... I have to sell my old Atari stuff to make room for other stuff.. :(Fortunately, my Atari will still live on through emulation on my iMac, but emulation ain't perfect.

Anyway, below is a list of what I'm selling. Right now I am asking $250+shipping for all of it. I will consider breaking it up if I can't find a buyer for the entire package. I want to sell to someone who will take care of this stuff and appreciate it the way I did. Reply to this in email if you're interested!

Original Software:
Phasar 3.0 - original box/manuals
Timeworks WordWriter 2.0 - original box/manuals
PC-DItto 3.0
GFA Basic
1st-Word
DB Master One/Megaroids
Space Harrier
Metro Cross
Epyx World Games
Epyx Battleship
Top Gun
Harrier Combat Simulator
12 Computer/Atari ST User/STart! disks

Books:
GFA BASIC
GFA BASIC Training Reboot Camp
Atari ST Internals
1001 Things To Do With Your Atari ST

Hardware:
1 1040STe - 2 megs, TOS 1.4 or 1.6
1 520ST - Half-meg, TOS 1.0 or 1.2
2 SF314 Double-sided double-density drives
1 SC1224 Color monitor
1 Beetle Mouse - may not work
1 Atari standard mouse
(the CPUs, disk drive, and Beetle mouse all come in their original boxes and have the original documentation, as well)

Magazines:
3 Issues of Current Notes (Apr, Oct, Nov 93)
1 AtariUser (Apr 92)
2 Atari Advantage (May, Oct 92)

1 Atari ST Informer (Dec 92)
1 Atari Interface Magazine (May, Fall 92)

PD/Shareware Library:
168 PD/Shareware disks
All programs are archived
Each disk is categorized (Productivity, Communications, Games, etc)
15 Magazine cover disks
The library includes one set of master disks, and then anywhere from 1-3
copies of each disk
The library also includes two bound catalogs
One lists all files in alphabetical order with the disk number they
appear on
One lists all the files by disk number order

That's the most likely explanation. You might be able to get an "O" ring of the same size as the original drive belt from maybe a hardware store or electronics supply house. Look for seals.

This seems to be configurable - my cross-gcc generates assembly listing
which look like this:

```
.file "test9.c"
gcc2_compiled.:
___gnu_compiled_c:
.text
.even
.globl _test
_test:
move.w _x,%d0
cmp.w #33,%d0
jbeq .L20
jbgt .L26
```

I know of the following:

- MagnumST
- Magnum/F030
- Multiboard
- Marpet XtraRam

Basically, *every* card that has alternate RAM that does not start at
$01000000 (which is impossible in a 68000 machine or falcon with the
original CPU) needs a driver program.

Source record: 1883

Hi

What would be the best way to pass C arguments to an inline ASM piece of code?

as in:
blaha(dummy)

and blaha is ASM code. Now i want to access the dummy variable, i know its passed on the stack but how do i know where? As it seems its different from time to time, caused by different OS calls?

Would this be he best way or can i put stuff into the data (d0-d7) or address registers (a0-a6) from C?

I use Lattice C from single tos.

regards
Fredrik

Yes but beware of scanning multiple folders, especially if your auto
prog is going to stay resident - it'll eat heavily into the "40 folder
bug" memory. If your prog returns before it triggers the bug then the
memory will be handed back just fine (ie best to spawn a child to
scan).

From: John Richardson <see@message.body>
Message-ID: <39590290_2@news1.vip.uk.com>
Source record: 1885

Hi Guys,

Can I use 2 standard 271001 (thats two 128kbyte) PROMs in STE hardware? If so is the full 256k addressable or is it limited to 192?

If this is not an option what are the alternative options?

Many thanks.

John.

If you know your compiler well enough you'd be able to figure out what
it does with certain arguments under which circumstances. Fortunately
it can be made a bit easier. Force the compiler to perform a standard
C call. That is, it should push arguments right-to-left and do so
using the stack - iirc Lattice uses __stdargs for this...

```
int __stdargs AsmFunc(int x, char *s, char c, int y);

//In C
int __stdargs
AsmFunc(int x, char *s, char c, int y)
{int z =(x+y);

printf("%d [%s] %c\n",z,s,c);
return -99;
}

//In (rough) asm...

internal_label:
ds.s "%d [%s] %c\n"
dc.b 0

AsmFunc:
link a6,$-4 //sizeof(z)
```

```
move.l 8(a6),d0 //x
add.l 18(a6),d0 //y (hopefully)
move.l d0,-4(a6) //z

move.w 16(a6),-sp //c
move.l 12(a6),-sp //s
move.l -4(a6),-sp) //z
jsr printf_
adda.l 10,sp

move.l -99,d0

unlk a6
rts
```

Note that I've guessed at the actual code generation but hopefully it demonstrates the principle. ;-)

27C010 work fine - if your type of 271001 is pincompatible, then it should
work (this depends on the manufactuter of the EPROMs - unfortunately, there
are two kinds of 271001).

And yes, you get the full 256K (starting at $E00000) - TOS 2.06 is too large
for 192K ROMs.

Is the lower start address ($FC0000 with current 192K ROM), due to the pin
layout of the new rom chips?

John.

No, due to the needed address space. $FC0000 - $FEFFFF provides only space
for 192K of ROM (and $FFxxxx can't be used, the IO space is in the upper 32k
there), so Atari had to put the 256K space somewhere else.

4179. Warning! -- SONY SUBSTANDARD SERVICE

Newsgroup: comp.sys.atari.programmer
Date: 2000-07-08 00:00:00 UTC
From: An_American_Consumer@evcyj.com
Message-ID: <6B12C16202630.xsact@asfsav.edu>
Source record: 1898

Anyone considering the purchase of a Sony peripheral for their computer
might want to give it some further thought. There clearly is not a
reciprocal relationship between what they sell and what they service.
-
I purchased a CD-RW drive back in April that just recently went bad
(won't read). When I called Sony service, I was told that I could not
get a replacement and that I had to ship it across the country to be
"repaired" (and we all know what that means...) - with a three (3) week
turnaround. Assuming that they keep their 3-week commitment, with
shipping both ways, I'd be without the use of the unit for at least
five weeks!!!
-
I hardly think that's reasonable or fair.
-
Compare this to HP, who under the same circumstances would simply ship
you out a replacement unit and issue a call-tag for the old one.
-
Sony is a behemoth in the marketplace and as such, they have an
obligation to scale their service facilities to meet demand. To not do
so is an indication of their lack of commitment to customer satisfaction
and an unwillingness to stand behind their products.
-
Buyer be ware!
-
-
-
-
-

Thought I would add....

Mighty Sonic 32 *
Afterburner * (if FAFAXX.PRG is used, Doug did change alternate RAM
detection/allocation within the A/B Tool Kit,RTM).

Both GE Soft utils added alternate ("TT") RAM to the system with Malloc
(initialized within the autofolder).

I think the Speed Resolution Card adds alternate RAM at a different
location than where "TT" RAM resides (for some strange reason) and did
have a specific driver, as Michael says below.

Thanks. But when I tried it nothing happened for the next fifteen
minutes and then I gave up ?!

So what I did was :

1. download xx.rpm
2. since rpm didn't work I tried :
3. rpm2cpio xx.rpm > xx.cpio
4. cpio --extract --make-directories xx.cpio

Any ideas ?
Gerhard

Hi,

Rafaï¿½ Kawecki a ï¿½crit:
>I'm looking for C (PureC) sources to show GIF and JPG files.

This is not exactly what you are looking for, but you can use
my lib "RIMM.LDG" (RIMM=RIM Manager). RIM are plug-in to Read IMage.
There is a RIM for GIF, another one for JPEG (very fast), and much more.

this is a LDG (Dynamique GEM library) which works well on
TOS/MiNT+NAES/MagiC... and you can use it with PureC, GCC, SozobonC
(i use sozobonx), GFA basic.....

You can download my programm RIRI2 from here:
http://perso.wanadoo.fr/arnaud.bercegeay/load_e.htm

This small programm just load a picture (using RIMM.LDG) and
display it in a GEM window.
the displaying/dithering/resize functions are done by SCREEN.LDG
so that it should work on all graphics cards.

All you need to run riri2 is in the zip file.

For now, most of the documentation is in french. If you have some
trouble with it, email me !

Bye,

Here's a list of some Atari ST stuff for sale. If you're interested or want to know more, contact me, Steve, at power@atarist.com

I've given you the prices but you'll have to add postage to this... (I live in London)

* * * * * * * * *

Atari 520STFM + owner's manual + mouse £10 (occasionally slightly temperamental but not a big deal. Sometimes the power cuts but just give it a little tap & it comes back on!)

Epson LX-100 dot-matrix printer. Excellent condition. £5

Joystick/mouse extension lead £1

Powerplay cruiser joystick. Good working order. £2

Master Sound Sampler (incl software & manual) £5

ST Basic Sourcebook and Tutorial £1

Atari ST Internals - The Authoritative Insider's Guide 500pp (Abacus Software) £3

HiSoft DevpacST 2 version 2 (including manual & pocket programming guide) £2

GFA Basic System 2 (including manual) £1.50

Atari ST original disks (£0.75 each unless otherwise stated) (* - includes instruction booklet)

Ranarama
Rampage/Wizball*
ST Basic
Oriental Games (2 disks)*
North & South*
Last Ninja 2*
Overlander*
Netherworld*
Zynaps*
Space Harrier (2 disks)*

4191. GNU and .o file help needed

Newsgroup: comp.sys.atari.programmer
Date: 2000-07-17 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <3972BA78.54B3EF4B@siemens.at>
Source record: 1810
Cross-posted to: comp.sys.atari.programmer,comp.sys.atari.st

Hi,

I'm working at a GNU project and have the problem, that my environment
generates other .o files than the one of other people working at the
same project (a800 emu) and the result of my compilation does not
work while the others do. For the Atari platform we agreed on GNU C
2.91.66 and GAS 2.9. The first things when we tried to synchronize
were bin/gcc and bin/gas where I gave up my slightly newer versions.
Then I took over the include directory. That too didn't help.
Does anybody have an idea what other files would be needed for exact
synchronisation so we could be sure to create exactly the same
programs ?

Thanks
Gerhard

Sorry about that last one. Haven't used Newsie before, but my
old Fidonet access doesn't work anymore.

I'm playing around with pseudo-random number generators, and
was thinking it would be a good idea to save the Random() seed
in NVM (non-volatile memory). That way you would get different
random numbers each time you boot up.

I can't find any info on which (if any) bytes in NVM are unused.
I dumped it, and found nulls in bytes 0-5, and several byte pairs
containing 0x123 scattered around. Anyone ever hacked into the
NVM before?

4195. Data structures initialised at compile time

Newsgroup: comp.sys.atari.programmer
Date: 2000-07-19 00:00:00 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <8l3p23$n7q$1@news.comnet.co.nz>
Source record: 1814

In a recent email conversation with someone, I was informed that Pure C has problems with data initialised at compile time.

The example they gave was

[quote]

```
typedef struct
{
char one[10];
char *two;
} FOO;
```

then the declaration

```
FOO s = {"foo","foo"};
```

doesn't work for s.two; it works for s.one, though. The only way to set s.two to "foo" is to explicitly assign it to the string, i.e. s.two="foo"; But this can only be done in a function.

[end quote]

Are there other compilers that suffer from this problem?

As my Toolbox DLL engine requires libraries to have a data structure defined and initialised at compile-time, this will make it difficult to write DLLs in Pure C, for those with that particular compiler.

(I am also told that the startup code is not supplied with that compiler, nor is it replacable)

How can I detect something compiled with Pure C, so I can act accordingly?

Or will I have to disallow Pure C as a DLL creation source?

--

Due to the amount of junkmail I've received in the past, this message has bogus From and ReplyTo names and addresses. I can be contacted via an intermediary : gem at gem win co nz. I would like to apologise to the genuine respondents that this may inconvenience.

Current MiNT version have a so called random device (/dev/random) there
you can read real random numbers (calculated from interrupts, keyboard
events and so on).

That's correct, but even with /dev/random you need a way to preserve the entropy pool across reboots - otherwise, you'd have to wait quite some time after each reboot before enough events have been collected to generate secure random numbers.

And that's also necessary for /dev/urandom, even though this one only generates computationally secure random numbers, because without a random (enough) seed, any PRNG will spit out predictable numbers.

Usually, that preservation is done via a script that saves the current state in a file and restores it on the next boot. The NVRAM won't be suitable for this, anyway, as you'd have to store 512 bytes(!) of random state information for /dev/random.

Ciao

Thomas

I have many docs, even an actual Atari devkit and that
information was not given out and/or documented. There some
programs that deal with NVM, perhaps these would give clues?

ohh... has it ?? I didn't remark this till now... I will test it...

> (I am also told that the startup code is not supplied with that
> compiler, nor is it replacable)
That's not true. The startup code can be exchanged with a custom one.
For example PCMXSTRT.O I found in the MagiC Library. Just replace the
old PCSTART.O in the project file. Or write a own file. There aren't
any limits!

> How can I detect something compiled with Pure C, so I can act
> accordingly?
The macro __PUREC__ is defined.

> Or will I have to disallow Pure C as a DLL creation source?
No... please not. PureC is a good and stable programming environment.
There are lots of people who use it even today! (Me too)

Greetings
Philipp

Even better: The source of all Pure C's startup files (pcstart.o,
pcxstart.o, and pcvstart.o) is included on the install disks, so you can
even modify the existing ones to remove the bugs they have.

Ciao

Oops. If you try to get more than 48 bytes back from NVMaccess(),
you get nothing.

It appears that only the first 18 bytes of NVM are used. For the
curious, on my computer they are:

$0,$80,$d,$41,$44,$4,$5,$44,$50,$10,$41,$4,$24,$0,$5,$4,$0,$90

followed by nulls.

4202. How to tell which Atari Basic Revision that you have

Newsgroup: comp.sys.atari.programmer
Date: 2000-07-25 00:00:00 UTC
From: w_a_lang <w_a_lang@willinet.net>
Message-ID: <snseqs2s3j175@corp.supernews.com>
Source record: 1821
Cross-posted to: alt.atari,comp.sys.atari.8bit,comp.sys.atari.programmer

The memory address that identifies which Basic that you have is 43234.

So when you start your Atari up, at the READY prompt, type in this command:
PRINT PEEK (43234)

You will get a value of 162 if it is Rev A Basic.

You will get a value of 96 if it is Rev B Basic.

You will get a value of 234 if it is Rev C Basic.

Amateur Atari historian and Devout Atari game player,
Wally

If memory serves, the TJPEG component for Borland C++ Builder comes
with full sources - iirc only the wrapper code is in C++ - the "jpeg"
stuff is in C.

That's great to know.

What initialisation does it do? (I've never seen/used Pure C - I do my development in Lattice C v5.60 and Devpac 3.1 assembler. Prior to that I used Megamax C and Laser C - IIRC all of which supplied startup code which could be altered)

Will it go crazy if one replaces the startup code with a simple "jmp LibInit" assembly instruction?

My DLL manager [called "The Toolbox"] is nearing a releasable state - complete with the 391 yet-to-be-discovered bugs and 27 inconsistencies. :-) Hopefully it'll be useful/usable after the 8 years I've spent developing it. All it requires is 32k RAM for itself, and AFAICT, it works well with MINT, but it isn't required.

After it has checked that the library being loaded is actually a Toolbox library (a structure must be defined at the start of the initialised data segment with known constant values), it does a subroutine call to the beginning of the text segment, which is assumed to be the LibInit function, which will allow the library to initialise itself, and check that the Toolbox version loading it is correct and return a success/fail code to the Toolbox.

(Normal startup code AFAICR, will parse the command line into argc and argv, setup internal buffers call main() and then do a GEMDOS Pterm() which makes it unsuitable to use as library startup code)

That's great to know.

What initialisation does it do?

If it's like other C compilers it will generally parse the command line into argc and argv, setup internal buffers, call main() and then do a GEMDOS Pterm().

(I've never seen/used Pure C - I do my development in Lattice C v5.60 and Devpac 3.1 assembler. Prior to that I used Megamax C and Laser C - IIRC all of those C compilers supplied startup code which could be altered or replaced)

Will Pure C go crazy if one replaces the startup code with a simple "jmp LibInit" assembly instruction?

My DLL manager [called "The Toolbox"] is nearing a releasable mid/late beta state - complete with the 391 yet-to-be-discovered bugs and 27 inconsistencies. ;-)

Hopefully it'll be useful/usable to others after the 8 years I've spent developing it. All it requires is 32k RAM for itself, and AFAICT, it works well with MINT, but doesn't require it.

After it has checked that the library being loaded is actually a Toolbox library (a structure must be defined at the start of the initialised data segment with known constant values), it does a subroutine call to the beginning of the text segment, which is assumed to be the LibInit function, which will allow the library to initialise itself, and check that the Toolbox version loading it is correct and return a success/fail

code to the Toolbox so it can either continue/abort the library load.

The command line parsing and especially the final Pterm() make normal app startup code unsuitable to use as library startup code

Hi !

It seems that Pure Software bought the license for the standard C librairies
from Borland.
So you can see Borland on Turbo C for ATARI (note that Turbo C was also the
name of one of the first Borland C compiler on PC)
After, Pure Software decided to call it "Pure C", but the standard
librairies are licensed by Borland.

See you, Jean

Ok, we all know that Atari is dead and gone, right? The Tramiel's killed the company outright (and after saving the company too! *sigh*). All it is now, is a brandname for Hasbro and their PC game packs. Sad, isn't it?

Atari technology is dated in the extreme. No support from Atari (gee, I wonder why?) and 3rd party companies have all but dried up and gone elsewhere or died out completely.

But I have always wanted to see a computer made that was the BEST it could possibly be. Think of it as the Atari ST on Mega Steroids!

Never gonna happen, is it? Well... not unless a few (or more) determined Atari ST programmers, enthusiasts, and technical types team up and help make it a reality.

While we can't bring Atari back from the dead... well, we *might* be able to in the future, if we play our cards right today... we can create the fresh beginnings of an Atari system revival in the form of a new system!

Think of it... GEM has been GPL'd. If we build a system, based on the 68040, that runs a classic Atari ST (68000) emulator in ROM, while a second EEPROM (containing an updatable version of GEM) contains "GEM2000" or whatever, programmers and developers can slowly port their ST apps to run on the 68040 for GEM2000.

With enough support from end users, developers, programmers, and a licensing agreement from Caldera (concerning GEM), we might just be able to revive the past into a new future.

With enough financial resources (from sales of this new system), we *might* be able to buy the company hardware rights to the Atari name from Hasbro, thus restoring the Atari computer hardware name and bringing basck Atari as a brand that sells computers again!

It may seem far-fetched, impossible, unlikely, or just plain foolish, but think about this:

People believed that Windows and MacOS were the only choices and that making another OS would be utterly foolish... along comes Jean-Louis Gassee.

That would be nice, I'm all for that - if we're still allowed to buy
American computers this side of the pond by the time you get it built.
We're being invaded by European legislation at the moment. They've
taken away our inches, feet and pounds, and are forcing us to use some
weird things called metres and kilogrammes. Now they want to stop us
having our own money and use Euro-money, and are trying to force big
American cars into the scrapyards by whopping up the taxes. I can
see them objecting to us using American computers next... but I digress,
my STe is painfully slow on the internet and I want a replacement
(but not a PC) - so get one built quickly! Meanwhile, I'm off for a
drive in my Dodge while I still can!

Actually, from the looks of it, Milan Computers, I think, owns the rights to TOS. Unless their English is mixed up in some way. Thus, reviving the Atari brand name in America might be more difficult, especially if it uses the same OS... but... if it phased from the old into the new (something still all-in-one integrated, like the ST/TT/Falcon has, but much more powerful), using my ST emulator in ROM concept...

But if this is going to work, we need to put together teams of people willing/able to make it happen. Unfortunately, I'm little mroe than an idea man without even the money I used to have to make things happen. Married life seems to have depleted my reserves for some odd reason... :-)

But it all has to start somewhere...

We need:

->Programmers to look at GPL'd OS's like CP/M-68K, GEM, FreeDOS, MinT, etc. An OS that isn't in common usage today. To that we would add a new GUI (I can work on the art/graphics/functions for that) and work on porting it to the 68040 or improving it to work better on such a processor.

->Enthusiasts (people who are still die-hard Atarians who still own them and use them regularly) to buy the system.

-> System designers to help draw up schematics of what the system's motherboard will look like with all the parts integrated.

-> People with money to help finance this whole deal and start a US-based computer company that will (hopefully) become Atari once again.

From what I've seen, the Milan040 "Atari ST" computer is a serious hodge-podge of PC motherboard design, mixed with a 68040 processor and a mutant TOS. It may look like it's an Atari onscreen, but I think what they've done is taken the corpse of the Falcon030 and thrust it into the vile den of PCdom (slots galore with all the compatibility issues (is this or that card supported by MutanTOS?) and plain motherboard ugliness and a tower case. Not how I envisioned my future Atari to look/act at all.

I think no matter what you do there is always going to be some
level of "patched-together" as you put it. No one has the
back bone or possibly the resources to design or redesign
custom chips and that is what made the Atari somewhat what
it is. It's is far to easy and cost effective to retro fit
some current card slot (PCI) and such into a clone.

You know ... if you were the designated US Importer
for the Milan 040 / 060 machines while working on
your project, you'd have a fairly good stream of
income for awhile. And if you pushed the Milans
REALLY HARD from an advertising standpoint, you might
even get past the purists to the home users who are
unhappy with Windows but are trapped in the
"compatibility" mindset.

It would be easy to build a base that way, then
"upsell" to your fully developed machine when it
is ready in a couple of years. Even home computers
are expected to be networkable, both with LANs and
the Internet, and that is likely to take a lot of
development effort right there.

I know I'm going to get a Milan II ... I've promised
myself I'll get one ... but I'd like to buy one from
a US dealer (like chro_Magic, for example) -- but the
dealers need a US Importer to handle them.

I've been giving your post some additional thought,
and it seems like a bit of study of the capabilities
of GEM might be in order to ensure a truly amazing
machine.

------- Thought Number One: Video Screens ---------

For example, the ability to open multiple workstations
means built-in support for multiple monitors. One
computer could support two real-time screens, either
side-by-side or one-atop-another to provide expanded
desktop space ... or two independently-running applications
(an excellent capability for a multitasking machine).

But there's no need to stop at two, when you could have
support built-in for a 2x2, 3x3, or 4x4 video wall. A
few tweaks to the AES and you've got a feature offered
nowhere else -- but remember to put some monitor connectors
on the back panel for easily implementations! For starters,
I'd shoot for support of four simultaneous monitors but
would allow for expansion to 16 (i.e., the 4x4 video wall).

------- Thought Number Two: Mouse / Keyboard ---------

A quick look at the hardware shows the keyboard has been
implemented as a stand-alone subsystem that plugs into
the motherboard as a peripheral. The keyboard also supports
the mouse and joyport.

Considered as a subsystem, you could easily build in the availability
of additional keyboard/mouse combinations. Combined with the
multiple-monitor support (above), you've suddenly got multiple
workstation support on one computer. Great for data entry,
web surfing (imagine it's use at a Cyber Cafe!), and perfect
for gaming where each player has a set of controls!

Assuming support for four monitors (above), I would suggest
built-in support for four /additional/ keyboard/mouse
peripherals using a 4-wire daisy-chaining interface such as
RS-485 (capable of supporting 31 unique devices using a
connector that looks suspiciously like a telephone "modular
plug"). The main keyboard would be reserved as the "console".

That would mean a built-in keyboard/mouse/joystick and four
plug-in keyboard/mouse/joystick peripherals.

Getting excited, yet? Good thing we've got MiNT available
to handle multiple users.

------- Thought Number Three: New AES Calls ---------

Although Atari did upgrade the hardware, the AES portion of
GEM (the windowing part) did not receive the additional calls
needed for robust support of it.

There has long been a need for joystick and joypad support!

EVNT_jstick( ) and EVNT_jpad( ) would be welcome, as would
an update to EVNT_MULTI(... jstick ... jpad ...). Matching
VDI calls that would "sample the state", "wait for input",
and "wait for change of state" of the joystick and joypad
ports would be welcome.

Naturally, there's more that's needed. But this gives you
the idea.

Take some time to examine the VDI and AES calls and
you'll see many hints about the unused capabilities
of the OS (... such as a 16-button mouse or ten
simultaneous RS-232 serial ports) that could be
exploited fairly easily on your new machine.

A look at history shows that Atari just threw the ST
together and got it to market as quickly as possible.
Now is the time to sit back, look at what GEM is truly
capable of accomplishing, and give it the hardware that
will cause it to sparkle and shine.

And when you're done, it will be leading edge. Again.

If I remember correctly, QNX (with Photon GUI) which networks
so easily that other machines are practically seen as an
extension of memory and other resources of the controller,
can support a screen with resolution of 32768x32768 pixels.
This "screen" can be distributed on several computers with
their monitors and you can, for example, drag an open window
from one monitor to another.

Btw. QNX (being small, fast, reliable and free) has recently been
suggested in comp.sys.atari.st as a possible new kernel for
Atari (clones) OS.

Now THAT is the kind of enthusiasm I'm looking for! YES! Not just the ever-popular "Little Red Hen" scenario (they wouldn't help with planting, watering, weeding or harvesting the wheat or making the wheat into bread, but oh... when it came time to EAT the bread, they were all there at the door)!

Do you have the skills to pull this off or are you simply knowledgeable in GEM, in general, and are only offering up suggestions for a potential programmer?

I need to know...

Besides, what better victory can there be when the enemy thinks you're dead and you end up sneaking up from behind them, tapping them on the shoulder, and smacking them upside the head as they turn around to see who it is! I would LOVE to see the look/reaction on people's faces when/if Atari is reborn making computer's again.

And think not that the 040 is the end... oh, no... I plan for the 060 model and then the PowerPC (or whatever is the next step up from the 060) models and on into what the future may hold! From the beginning it was Motorola and it can be again!

The Milan040/060 is, to me, nothing but a PC pie with an Atari crust... and from the look of it, they're trying to wean away from what Atari part is left in the Milan060

What length of warrantee would you be expecting? 90-day? 12 month?
24-month? What kind of warrantee do the people that make the Hades060
offer?

By the way, what is it with hell and demonic creatures that European
countries have such affection for? I mean we have mail daemons, Madusa040,
Hades060, etc. Why? Aren't there any Christians in these countries? Or
are all these countries demon-possessed minons of Satan? :-)

Now, why does it matter where the machine is built? As long as the
machine is available in the US as well, there should be no problems.
It's obvious that the Milan 2 is available in Germany first since the
Atari ST sold here well and has many professional users.

Offset Size Meaning
$00 Word The jump to $1a
$02 Long Length of TEXT segment in bytes
$06 Long Length of DATA segment in bytes
$0A Long Length of BSS segment in bytes
$0E Long Length of SYMBOL table in bytes
$12 Long Reserved
$16 Long Program flags
$1A Word Relocation table flag ABSCODE. If zero there IS a
relocation table.

Program flags:

Bit
0 Fast load: if set only the BSS area is cleared
1 Alternative RAM load: TT only - if set program is loaded to
alternative RAM
2 TT only. If set Malloc is satisfied from TT RAM.
26-31 TPAsize. How much alternative RAM the program considers to be
enough to use.

Roger

Presumably the idea is to maintain backward compatibility to
existing Atari software, but that means perpetuating all of the
mistakes as well. Besides, many of the peripheral chips are no
longer manufactured.

To the extent you add new features, or even new hardware, you
lose a certain amount of backward compatibility. Eventually,
you wind up having to write all of your applications from scratch.

The big question is where to go next. Personally, I am dissatisfied
with either Windows, Mac OS, Unix (Linux), Java or BeOS.

Source record: 1759

No, the idea is to allow people to run their old apps (from an emulated Atari ST) and give a chance for them to port them to the new GEM specification on the new processor (the Motorola 040/060/PowerPC or whatever). In the end, people will have the same/new apps running on a different/new system made by the revived Atari Corporation, provided we can team together to pull this off.

A dream is only impossible if no one believes in it. No one thought BeOS would have a place, much less survive (or have any place in today's Windows/MacOS mindset), yet it lives, and is known and used by many. Can you imagine what the reaction will be when people start reading in computer papers and online and across every affordable outlet that... Atari is back? I wouldn't want to be standing nexct to the loyalist... I'd get trampled! And, let me tell you, I'd trample myself if I heard such news.

The Alternatives we have today are people's belief that the old must die, because it has, and that we must PC-ify it in order to make it sellable. I don't believe that. I believe you can have the old and make it new and people will gladly buy it. Just because we nay not be able to afford to build the custom chips of old doresn't mean we can't make the same, great all-in-one integrated desgin that once was, and fit it with today's technology. If it's made by Atari, THAT'S what I care about.

Did we care that our ST's were considered far inferior to better Amigas and PC's? No. We held onto them because we liked how they looked and felt and worked. Preference ruled over fact. Just because one computer is better than another doesn't make it better for us and mean we HAVE to own it. As long as oiur systems are supported, regardless of it's technological inferiority, we gladly hang onto it. We're only disbanding because Atari is dead and everyone believes that it's time to move on.

Well, I say... SCREW THAT! Let's band together and prove fate and history (and the Tramiel's, for that matter) wrong! Let's kick the nay-sayers in the groin and march towards our dream! Let us do like Noah did (this is just a symbolic example, not to be taken literally) and do what we know is the right thing, even though others believe we're crazy.

And if we all build the ark together, and get in it together, we can be inside it when the rains and floods of our victory take over the masses. But we remain a victim of history if we choose to believe that history is absolutely unchangable and that Atari is forever dead and gone and that nothing we do or say can ever change that.

Why should the Amiga be the only computer (technology?) that never dies... why can't the Atari Corp. we knew and loved return from the grave? There is no reason at all, so long as be make a decision to make change happen.

You can lead a horse to water, but you can't make them drink. Let's give that horse a REASON to drink the water, eh? :-)

Look around you... there are dozens of web sites dedicated to Atari. Why not start giving them something to REALLY support instead of ghosts of the past? People leave a place when they aren't given a reason to stay (or are utterly forced out)... the party ain't over, guys, unless we stop playing the music! I've got my guitar... if you can carry a tune! :-)

&#65533; would like to have a slice of this cake too. Which means that I want a PAL system, not NTSC!
And, why throw in an nVidia chip? I want a 100% compatible atari ste system, which means that if we are going to use a faster cpu it has to have a dynamic clock speed.
The biggest problem would be to reproduce the blitter chip. Since it is custom made, I haven't looked into it's internals, but probably it can be reproduced with an fpga or perhaps a micro controller.

If we build this system, we will eventually make one for the European market as well, which will mean PAL for all. However, I'm planning on using off-the-shelf chips/chipsets until the company (or Atari itself, if we can ever get it back) has the finances to build custom chips again (which I would just LOVE!). The most important thing is that we're working to get back Atari as a computer company from Hasbro and all rights therein. They can keep the game software rights, as that's all they're using right now anyways.

As I wrote to someone via Email:

This isn't a job for people who don't care. Hasbro obviously doesn't care about Atari except for the namesake and software titles, as we've seen recently. No, what we have to do is start a company, make an "Atari" system, get people to buy it, write/port software for it, and then, with enough financial backing (I'm guesstimating possibly $1 million or more), we approach Hasbro and ask to buy back the rights to the name and properties of Atari as a computer manufacturer. Hasbro hasn't done anything with it, so why not sell it to someone who CAN! If we succeed at this, we, as users, will own/run Atari! Just the way it SHOULD have been since the beginning. Afterall, who knows better what WE want out of a computer/company than WE do, hmm?

If anything writing-wise is to be done, we need to find out what procedures and expense would go into buying back the rights to the name/properties of Atari as a computer company. Hasbro can keep the game software title rights... we couldn't care less. We just want the company/computers back, right?

I'm working on putting a website together to support this (deemed probably impossible by many) dream. However, if you have the resources to do so (i.e. do the site yourself), I will show you my statement to the Atarian public I've written up to be shown on that page.

Sounds like you're with me on this... are you? It will require many users, enthusiasts, developers (hardware/software) and financial resources to build the company and the computer to which will give us the leverage we need to convince Hasbro we mean business about getting Atari back.

Unless someone has a few $million$ laying around and wants to simply engage Hasbro in an outright buyout of the Atari company rights. Money oft talks real fast and easy... But we still need more money after that to build the new Atari systems... so, even that isn't the simplest route, though it would be the most direct. :-)

Do you think this is a good way to go about this or do you have a better route in mind? And, most importantly, do you believe (as I do), if enough of us team together on this, we can actually pull this off? This is not some "Gee, I sure wish...". This is a "If we get together on this, we're gonna DO IT!" I've done the wishing (Atari was still alive, I ran Atari, Atari had done things differently, etc.) game since Atari died. I'm tire of it and ready to actually DO something about correcting the past and building a new future!

So, talk to everyone who will listen! Go to every site you can! Grab every willing volunteer! Take down names and faces, men! It's time to take back the company that rightfully belongs to it's followers! C H A R G E !!!!!

I don't know what medusa offers, I never bothered to check as the
over-seas order idea don't sit well with me. I suppose 90 days
would seem fair, as long medusa's is at least that long.

It occured to me many times that hades has been around for quite
some time. As far as I can tell everyone who has one is very
happy, in fact refuse to re-sell them to me if I ask. It also
appears to be well support as far as clones go. Why not put
the effort into supporting and importing this machine?

It don't come with magic or mint, so it don't upset either
camp. You decid that when you get it. All it really needs is people
to write drivers for some of the newer cards out there.
I could kick myself for missing the chance to get one when
it was available over here in the US. I just don't think that
we need another clone with another design, unless you intend
to duplicate the custom chips.

It's a very good way to sell a new computer IMHO. By packaging MagiC along with
a selection of MagiC-friendly software they can be sure that the buyer ends up
with a compatible system out of the box. Saves a lot on after sales service.

```
Here is some C stuff I found in "Atari Profibuch ST-STE-TT".
Only the MultiTOS/MiNT extension is missing (memory protection flags).

typedef struct
{
WORD ph_branch; /* Branch to the beginning of the program (0x601A) */
LONG ph_tlen; /* TEXT segment size */
LONG ph_dlen; /* DATA segment size */
LONG ph_blen; /* BSS segment size */
LONG ph_slen; /* Symbol table size */
LONG ph_res1; /* reserved (perhaps it's used for MultiTOS??) */
LONG ph_prgflags; /* special flags (fastload, malloc from TT ram) */
WORD ph_absflag; /* 1 means: no relocation data available */
}PH;

Program file components:
* Program header (PH)
* TEXT segment
* DATA segment (if not 0)
* BSS segment (if not 0)
* symbol table (if available)
* relocation table (if available)

Good luck
Philipp

I see how that could make Milans after service easier to maintain, but I still think it is unfortunate that the buyer is forced to buy a MagiC-system. Milan did have NAES as main on before, so it seems to me like if they would not have all that much trouble allowing their customers some choice when it comes to the OS.

As far as software compatibility is concerned I think that serious software should be both NAES and MagiC compatible all the way where possible. (at least when it comes to commercial software, but I also think this platform is getting too small to have people writing OS/AES dependant programs when they should be able to keep them working on more than one)

I also guess most Atari users that still are around would not be in need of support very often since they tend to know their stuff pretty well.

This really should go to the advocacy newsgroup...

Personally, after using it for almost 3 months, I am very happy with the way Windows 2000 integrates everything: mail, browsing, different networks, word plug-ins in Explorer, etc. The only drawbacks are: insuffificent and improper Ethernet routing and, surprise, surprise, a Word 2000 that is even less stable than Word 97 ever was. In other words, the OS-level integration of several key features is awesome, but the weak components is not.

Mac is even more attractive than ever. Both the look and the feel are in the great tradition of bringing a computer down to the simplicity level of a toaster, with great, compact space-age hardware designs. Their only drawback are: price, availability and support. I can go to any convenience store and find printer labels that come with their own Word template on a floppy. Mac templates are just not there.

Linux is fun to use, once you figure out how to use Dselect. The only annoyance, so far, is the incomplete support for some older hardware. Otherwise, things are progressing rather well on the user-interface level and ease of setup.

BeOS is really tempting, as many graphics and music software companies are porting to it. All the code compatibility of Unix under the hood, hidden behind a cutesy user interface. Yummy!

Please check the site of Rodolphe Czuba.

Rodolphe already has the hardware part covered and ready to ship.
It's called the Phenix. What he needs (which has left him) is a
programming team to port The Operating System to his hardware.

Sorry, I don't have his URL handy, but you should be able to find
it using Metacrawler.

I really don't like having to buy for a OS that I'll throw away as soon
as the machine arrives. I think that it should be optional what OS you
want NO OS at all. This way they could sell it with MagiC to newbes and
without OS to me, so I could install what I want :)

This is becoming one of those "Is this Pentium Linux-friendly and
does it sell with Red Hat pre-installed? No Windows here, thanks"
kindof thing... ;-)

Hi!

Martin-ï¿½ric Racine <q-funk@funkyware.atari.org> wrote:
> Linux is fun to use, once you figure out how to use Dselect.
^^^^^ ^^^^^^^

You're obviously speaking of Debian/GNU Linux here. Almost all
distributions come with their own installer / packaging tool, dselect
just happens to be the one for Debian/GNU Linux. Thus, understanding
dselect isn't necessarily crucial for using Linux.

Of course, for Atari hardware there are (to my knowledge) only
Debian-based Linux distributions, but as you've already written about
Win2k and MacOS above, I don't think you were just talking about Linux
for Ataris.

Ciao

Thomas

I tried Linux on the TT once. Horrible!

Now if you want a 100% STE compatible system, that means you need:
- an original 68000 CPU - no 020, 030, 040 or 060, since that breaks
compatibility with some programs.
- a video system that is compatible at register-level, which means you
can't have higher resolutions or more colours without breaking
compatibility.
- an ACSI port, plus a compatible replacement for the WD1772/Ajax floppy
controller which is no longer in production.

All this will severely limit your design - but what do you gain by aiming
for 100% compatibility? A machine which *is* some kind of befed-up STE,
nothing more.

>The biggest problem would be to reproduce the blitter chip. Since it is
>custom made, I haven't looked into it's internals, but probably it can be

Doing a blitter of this kind in a modern FPGA is no big problem. However,
you can probably get a ready-made graphics controller engine with integrated
RamDAC, a 2D/3D engine which can do a lot more than the blitter, and without
any design effort, for less money.

It would be great to have the Hades060 being sold here in the US. It would be even greater to have a more upto-date machine. By that I mean a Hades060 that had a speed of 80mzh, DMA sound, better PCI BUS (more standard with the rest of the world), USB port and more. I cannot understand why Medusa Systems has not done this. Oh, I forgot to mention the caching concerning the SCSI port. Get rid of it.

No I'm not. NVDI, do you have a datasheet or url? Is this 100% blitter compatible?

I get your point. And of course you are 100% correct, I would be better to
make it a whole new atari.
Then the big question is, what do we want to keep from the old atari, and
what do we want to replace?
Neither the original blitter or the YM2149 would make it in todays market,
and if we remove those (especially the YM2149) would it still be an atari?
One of my fondest memories from the atari is the sound of the synthesizer.

Which is probably a much better idea from all angles.

Still, I want to be able to play my old atari ste games on this machine
(very much like I can play my old 286 games on my 686 system (this can be

discussed though ;))
Then, could we maintain at least some backwards compatibility by using a
newer 680x0? (I have never studied any of those architectures)

NVDI is software - it replaces and enhances VDI (NVDI supplies a GDOS,
vector fonts, functions for bezier curves, enhanced colour bitmap functions
etc.).

And even on a normal, unaccelerated ST, it is faster than the ROM VDI with
the help of the blitter. On an accelerated CPU, the blitter falls back even
more.

We couldn't use MagiC if we want to make a new architecture (although
somewhat atari-like ;). The best thing would be to write a new OS (a
GEM-clone of course), and put it on a flash-rom, that way it could easily be
upgraded by using software. (The question arises though, perhaps it would be
MUCH smarter with a bios on flash rom and the os on the harddrive ;).

Hm - I always thought about the ST in terms of software and operating
systems. I always thought of the YM2149 as a way to produce the system beep,
nothing more. For good sound, use digital sound (like the DMA sound on
STE/TT;Falcon).

Difficult. Even the 030 breaks a lot of programs that were not written with
portability in mind, and the 040/060 are even worse due to improved caches.

You have two options: either a very compatible machine, or a really new,
improved one that runs TOS plus all clean applications on a hardware that is
a complete redesign.

When we designed the Milan, we decided to go the second way - if you want
compatibility, use your old STE to play the games on. By not having
register-level compatibility for games, you gain a lot of freedom in design
decisions.

That's what we're after... a brand NEW Atari computer, but made BY Atari.
Aye, there's the rub... and it sure feels good! :-)

Without Atari Corp. all Atari clones are simply hacks to keep the dying
from utter death. What we propose is the restoration of Atari Corp. itself
(in the US first) and the design of all-in-one systems like before... except
a LOT better!

Atari Phoenix (not Phenix), anyone?

It might take millions of dollars, but if we believe in the dream enough,
those millions aren't such huge numbers, because we're ready to fight the
"Giant of Impossibility". Are you?

Keep: TOS, MiNT and GEM as OS, and m68k as CPU architecture.

Germany is a better market and better place to start it, if only because of the _huge_ competence.

Do remember that while the Tramiels could not make their mind about what to make of Atari, the president of Atari Germany saw the potential and hired several sub-contractors to develop solutions and port Unix, etc. which is how the Riebl Ethernet card for MEGA and TT saw the light.

Build what you will, but I will still buy a hades060 if it
hits a dealer over here. Maybe I am bias, but I love my TT
so a hades060 makes sense for me. ;-)

But if you have a 68000, you need an MMU, which increases the overall
cost/complication of the system. Would the 68060 get confused by the extra
MMU, since it has it's own, or...?

The thing I'm wondering is... can you have a dual 68040 or 68060 system and
then address/access data 64-bits across, allowing the use of DIMMs, instead
of 72-pin SIMMs for memory? Can you use SDRAM? Things of that nature...
```

Hu? Why would you need an MMU? The ST has none and runs just fine.

I guess you are confusinga paged-style MM;U (which the 060 has) with a
memory controller (which Atari called "MMU"). The memory controller is
needed anyway, regardless of the CPU used. It will have a different
interface for 00 and 060, though.

>The thing I'm wondering is... can you have a dual 68040 or 68060 system and

No. But you can use DIMMs in a 32-bit system (and of course without throwing
away half the capacity). It's the same as using PS/2-style SIMMs (which are
32 bit wide) in a 68000 system (like the MagnumST does).

>I need to know...

At this point, I'm a dreamer. If you're going to come
up with a new machine, it has to be forward-looking to
have a chance to survive and grow.

Other thoughts:

Generally, my suggestions spring from the following desires:
** Make the programming easy for the new programmer. That's
what got the early computers going, and that's what we need
to keep TOS/GEM going. That means clear documentation
with LOTS of examples!
** It is necessary to keep the computer experience as simple as
possible. The original ST, for example, could "sense" the
attached monitor as either "monochrome" or "color" without
requiring any adjustments by the user.
** Expandability is important, whether it is supporting a ludicrously
large amount of RAM, or providing daisy-chainable ports (such
as RS-485 or that new one they're using on the IBM/clone
platform).

Other thoughts:
** To stand out, the computer must do one thing VERY WELL, and
I think the built-in video-wall support will easily set the
machine apart from others, even if only 1 in a 1,000 customers
actually uses the video wall feature. In the past, people
associated the Atari with MIDI and music, the Amiga with the
"video toaster", the MacIntosh with "creative types", and clones
of the IBM-PC with "business". The Milan is aiming to be an
"Internet Appliance", the Amiga is currently down for the count,
so video applications look like a good area.
** Don't limit yourself to video, either, since the DSP-equipped
Falcon heralded the era of sound editing as well. Consider the

need to make TV commercials ... or complete features ... business multimedia shows ... Music CD mastering ... animated shorts ... visual training manuals ... live security systems with data logging ... multimedia web pages ... there's a lot that needs to be addressed!
** And how about some video peripherals? How about a VCR designed to be controlled by computer? That would be another use for the RS-485 port -- but you'd need a VCR that supported the port and acted upon the commands received. And how about an AM/FM tuner that is controlled by computer input, as well. Why ... you could have a computer-controlled home-theatre experience! And if not a complete VCR, how about a way to plug in a camcorder video tape into the computer for direct control/view/editing by video software?
** Don't forget the other purposes for computing: Word Processing, Spreadsheeting, Databasing, Internetting, etc. But do one thing extremely well.
** Multiple RS-232 port support (mentioned previously) is a nightmare on the IBM PC, and is ignored on other machines. Providing OS support (and back panel connectors) for 4, 8, or 10 simultaneous serial connections will be an eye-opener. It could easily be used as a "poor man's" networking method, or a "data concentrator" that monitors 8 external instruments/peripherals from a central location.

Actually, I kinda like the idea of a twin-processor system: 68000 with ROM TOS for compatibility purposes, and a 68060 -- or, even better, a pair of 68060's with flash rom OS -- for power users. You could add a new XBIOS function to the 68000's TOS (a function called during the power-on self-test) that performs a checksum on the 68060's flash rom on startup, taking over if it finds corruption. It would have the NEW ability to reprogram the flash rom from floppy / CD / the Internet. Without corruption, the 68000 would recognize a good checksum and allow booting to continue as specified in the startup sequence to run with either the 68060/flash system or the 68000/ROM system.

Heck, why not FOUR sockets for 68060's? Ship the basic unit with one 68000 and one 68060 and allow the OS to detect and support additional processors as they are installed. What's the fastest 68000 available these days, anyway? Could we use the same 80 MHz clock on both chips?

One does not really need much more than this:

* Base10/100T Ethernet
* MIDI ports (in/out)
* RS-232 (DB-9, SCC-B)
* RS-422 (LAN, SCC-A)

Modem1 compatibility could be handled by software and forwarded
to the ESCC as Modem2. It's actually a very good idea to use an
ESCC, because it maintains backwards compatibility with previous
Atari practices for the MEGA-STE/TT/Falcon for LAN/Modem2, but it
is a much more reliable chip and still available.

Here's one way to maintain compatibility for relatively low cost:
Get a VMEbus card cage, put a STE clone on one card, and use other
cards for improvements. Everything except the STE card can be
bought off the shelf.

The question is just how many other chips are needed, which depends
on how much software you want to maintain backward compatibility
with. The MFP and sound chip were used for a LOT of things not
supported by the OS.

it does not slow down, but with a faster CPU, the relative factor between
CPU and blitter increases.

So yes, with a faster CPU, the slowdown expired by enabling the blitter is
more noticeable.

4285. GNU C & environment question

Newsgroup: comp.sys.atari.programmer
Date: 2000-08-04 00:00:00 UTC
From: Janka Gerhard <gerhard.janka@siemens.at>
Message-ID: <398A6F6E.650E4424@siemens.at>
Source record: 1704

Hi,

Some weeks ago I asked for help because GCC 2.95.2-4 did compile
a source but the compiled program crashed with memory violation
although another guy who compiled the same source with GCC 2.91.60
got a working program. In the meantime I installed, one after the
other, 2.91.66, 2.91.60 and 2.8.1. I even tried it after deleting
the whole contents of the partition. Every time with the same result.
So I think the problem lies somewhere else and not with the GNU C.
But I haven't got the slightest idea what else could have an
influence on the compilation result.
My system is a CT2 Falcon with MiNT 1.15.1 and N.AES 2.0. The guy
where it works has an AB40 Falcon with KGMD. Quite some time ago
I had MiNT 1.9 IIRC and N.AES 1.2 and GCC 2.8.1 was able to
compile that source then.

Anybody out there with any idea what could be the problem ?

Thanks
Gerhard

One thought for backward compatibility is sort of dual-boot where when you boot-up you choose from multiple TOSes (similar to GEMulator). The best would be a new TOS somehow taking the old 'bugs' into account that are needed by some programs though. It was a disappointment that several programs no longer worked on the Atari TT. I remember that David Small had found a solution to some, but didn't want to reveal it.

To me it is a shame it only went for that much. Like everyone knows, Hasbro
was only interested in the rights to the older classic games. It should not
be too hard to get the computer rights. It is too bad also that Hasbro is
not going to remarket the Lynx or the Jaguar...

You have the right idea. I *do* want backwards compabibility, but ONLY for porting purposes to the new GEM OS. That backwards compatibility would be in the Atari ST emulator you can switch to/from, while the new GEM OS is on a seperate ROM. Both read from the same HD format, so you learn the new OS, go over and port the old Atari app(s) to it, then boot into the new GEM OS and try it.

In the end, when all the apps are ported, those programs will look like they're running on a modified TOS (much like the way the Milan does today), but, in reality, you will NOT be able to run those same apps on the emulator anymore, when the port is complete. GEM will look similar and be similar functionally, but the enhancements I've heard mentioned (and others) will make it much better. Does it matter if the apps you love run on an old model ST or a new Atari if they function identically? I think not. That's the whole premise to porting... to get the apps we love brought up to date with todays hardware, not just force them to run on newer hardware with a hacked up TOS. By the way, that Milan TOS picture I've seen on their site is the ugliest I've ever seen! What, does it use only 16 colors, if even that?

With the Atari name restored and new computers that function similarly to the old ones (maybe even look similar), you won't know the difference except that everything is more powerful. I refuse to believe that a 68040/060 is incapable of doing everything, including browsing the web. All you need to do is optimize the hardware and software to do the job.

Sure, it isn't as fast as a Pentium III or an Athlon, but if you don't NEED that power, why have it? And, with time, we'll get there... maybe sooner than you think. It's all about SUPPORT. If your system is no longer supported by the company and all the programmers go away, that sure isn't any fun... it's like... well... like living in a ghost town all by yourself! Not my idea of a picnic.

You can only keep the dying (legacy Atarians) alive for so long on life support (clones) ... you either have to pull the plug (everyone moves on) or revive them (srestore Atari itself) to make them live again. The latter is what we propose. It's all quite simple. We just need to formulate our plan. Naturally, it's also dependant upon whether or not hasbro will even budge. If they refuse, nothing we say or do will change that... unless multiplied millions are accessed to do a hostile buyback, which I think could work, but... it would require too many resources (both financially and supportively) and, considering how little vocal support I've gotten from y'all, I don't think a direct buyout of any amount would work. So, we go to plan 2!

It's hard for me to believe that the next president of the United States will be George W. Bush or Al Gore. Both remind me of Hollywood movies that have been focus-grouped to death: they push all the appropriate buttons, but have zero original vision. Both stand for the same thing: corporate-driven business as usual.

There must be some way outta here.

Ralph Nader is no joker or thief. I think he and the Greens could give Al & George a good run for their money. At 65, Nader isn't running as fast as he used to, and the Green Party doesn't exactly have its platform figured out, but I think they have what it takes to inject a dose of radical democracy into the race. Unlike the two Tweedles, Nader is real, he stands for decency and common sense and he still commands a lot of respect in progressive and activist circles. And hidden behind the rainbow coalition of lefties, eco-feminists and crazies, the Green Party does have some great ideas. It's the only party that stands for the Tobin Tax, true cost markets, media reform and putting corporations in their place.

In October, with a fired-up Nader hurling intelligent sound bites into the presidential debates, the whole game show might actually be worth watching. The alternative is the most sophomoric presidential race in American history . . . and the lowest voter turnout ever.

I'm putting a GO GREEN - VOTE NADER graphic at the end of all my emails from now on. I'm betting that, between now and November, the American people will wake up to the fact that their sacred democratic experiment has now degenerated into a choice between a corporate-sponsored Republican and a corporate-sponsored Democrat.

In these heady post-WTO days, a sudden, massive protest vote against Al & George is entirely possible and Nader would be the most apparent heir. With perhaps less than 25 percent of the people voting, an inspired Nader campaign could grab a surprising share of the action. And even if he does not come close to winning, at least imagine how his campaign might pull together some of the fired-up, post-WTO forces and lay the groundwork for something really visionary in 2004.

Download the graphics and help launch an email pyramid scheme to dump the Tweedles! Two formats are available, a magazine

sticker (17K) or a Banner ad (5K):

==========

What it Means to be Green

"At the root of all Green political action is nonviolence, starting
with how we live our lives, taking small, unilateral steps toward
peace in everything we do. Green politics requires us to be both
tender and subversive. Affirming tenderness as a political value is
already subversive. In Green politics, we practice tenderness in
relations with others; in caring for ideas, art, language, and
culture; and in cherishing and protecting the Earth. To think Green
is to build solidarity with those working for social justice and human
rights everywhere, not bound by ideologies."

-Petra Kelly

It may be sad news ... but does that mean we cannot
continue? With a bit of work, it is possible to
construct a new machine that lies outside of the
existing tunnel-vision of most computer users -- one
that would delight and amaze.

Take a step back. Think "what would the computer
owner want to do with his/her computer?". Once you
have that idea firmly in mind, you can work wonders
with the existing TOS/GEM OS.

Which is why it still flourishes, even in clones.

I think you care too much about the name.
```

Atari (as we know it) is dead and gone alright. So therefore, even if you gain the right to the name "Atari" and actually get to release a new computer I&#65533;d say it would not be any different to any of the existing clones really. It would be a TOS compatible computer (hopefully) but with the "atari" label on it.

As I've said before, clones are simply an effort to keep a dying breed from total death. It's a way for companies who loved Atari to pay tribute to the loyal following. Do you find Amiga clones? Not that I've seen. And why is that? Because somewhere, somehow, someone was able to keep Amiga alive, in a genuine real sense. Not just by cloning the original systems, but by actually keeping the computer, itself, alive!

Perhaps it is that the Amiga was a more special, more powerful computer to begin with. Or that it had a more popular following all over the world. But, for whatever reason, Amiga is still alive and Atari is dead.

Kinda odd, isn't it... a brand name/computer lives on from one company that died, while only clones of a computer exist from another company that was killed. Maybe the suicide of Atari forever cursed us from ever gaining back the glory days of old. These days, it seems, are good days to be an Amiga user.

I shoulda bought an Amiga 1000 in '86 instead of an Atari 1040ST. It's that simple. My loyalty to the company, Atari, has lead me to this dark present, while Amiga users have something to really cheer about these days, from what little I know about it.

Any opposing thoughts or insight on the matter?

IBM is still around, as are computers made by them. Sorry, no comparison.
If Atari clones existed in the midst of Atari computer, that wouldn't bother
me one bit. But there are no more Atari computers.

The old Atari was killed by the (!!!) Tramiels! If Atari was alive today,
makinbg computers, I'd buy one of the spot. New/old. It doesn't matter to
me. Just make sure it's by Atari and Atari based in the USA!

To me a motorcycle that looks/works like a Kawasaki is NOT a Kawasaki
motorcycle. The name is half the importance! At least, to me, anyways...

Again, why is the name so important? The TOS-platform (which is what matters to me) would certainly benefit more from people supporting the machines that already exist (and perhaps improve their performance) instead of wasting money on buying back rights to a company name.

> It's a way for companies who loved Atari to pay tribute
> to the loyal following. Do you find Amiga clones? Not that I've > seen.

And you are jelous about that? So should people that bought early IBM-PC:s be sad because there are zillions of PC-compatibles available now too?

> that? Because somewhere, somehow, someone was able to keep Amiga alive, in
> a genuine real sense. Not just by cloning the original systems, but by
> actually keeping the computer, itself, alive!

If a new ATARI computer actually would see the light of day, it would not be a product of the old atari anyway. It would be a completely new company, that would have to design a new computer from scratch. You would probably need to have an updated TOS compatible OS. What would then make it different to any of the clones?

> But, for whatever reason, Amiga is still alive and Atari is dead.

Yeah, sad but true. Perhaps it is time for you to get over it? The company is dead but the platform is alive. I&#65533;d say, put your efforts into something that is good for the platform instead of chasing ghosts.

> I shoulda bought an Amiga 1000 in '86 instead of an Atari 1040ST. It's that
> simple. My loyalty to the company, Atari, has lead me to this dark present,

Seems your loyalty to the company is more important to you than your dedication to the TOS-platform. I care for the atari platform, the company itself is dead. If you would like to see Atari computers shipping with the name "atari" on them, it would be easiest to help Medusa systems, or Milan to get the rights to the name "atari".

That was not the point really. You seem to have a strange idea that only
the company that once set the standards is valid. Even if it is dead..
So if IBM is gone, lets leave the PC:s?

You are beginning to sound weird. You mean you&#65533;d buy an Atari right now
on the spot just for the sake of it? Why is it important that Atari is
based in the US? If that is the reason for you to resurrect Atari I
don&#65533;t even want to wish you luck, even if I&#65533;d love to see Atari back
again.

A new computer (even if made by a company called atari) would still be a
TOS clone, nothing more, nothing less.

> motorcycle.

Yes of course, but if Kawasaki stopped making motorcycles people would
not through away their drivers license...

> The name is half the importance! At least, to me, anyways...

Name Atari would be cool to have, but it would not matter if Ataris were made in Paraguay, USA or Germany. And I dare to promise you that to most people still active on the Atari scene, it is TOS as a platform that matters. But if the name is half the importance I don't think you are at all well suited to ahve anything to do with the "resurrection" of Atari computers.

I am getting tired of this thread, so don't be upset if I choose not to reply again, because that *might* happen. You seem only want to comment parts of the stuff that some posters have written. For example, have you ever once explained why you need to have Atari based in the US?

I think it is a pity you do not use the energy you obviously have to do
something to support the TOS computers that are alive.

The reason I want Atari to be US-based, is for the same reason that makes having an Atari (um, I mean TOS... excuse me) clone nigh impossible... if Atari was based elsewhere, how hard do you think it would be for me to actually get one? VERY! Not to mention that Atari headquarters has ALWAYS been in the US (California), that I know of.

But then, for the same reason(s), you probably DON'T want it in the US, which could be understandable.

Luposian

P.S. Just remember, what you call TOS computers today, were taken from the heart of Atari years back. If it hadn't been for Atari, your precious TOS clones wouldn't even exist! Never forget that. Atari is why they exist today and why I am fighting to get them (Atari) back. I don't want a ghost. I want the living!

Perhaps you could create a new company that writes screen and printer drivers for the USB on the Milan?

To date know one has pickup the offer to do this. They are still looking for someone to do it.

You could could make drivers to support the Atari products run on clones and emulator to interface with Atari VDI.

Call it SVDI, SuperVDI.

Raymond

People want their TOS computers, right? They want their slots, right? They want it all, right? Well, so do we!

What if (the new Atari) computers were simply modified PCs? You alter the BIOS a little, to allow for an Atari splash screen. You have an Atari ST emulator that boots first, unless you press a certain key to go into GEM2000! And since GEM was originally written for a PC, can you imagine how fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not to mention a Pentium II/III, if optimized? Yee-haw!

Sure, you could more or less do that already with a PC today, but assuming anyone cared about the BRANDNAME (unlike most people here, it seems), it still wouldn't be the same.

We would have affordable, already-made PCBs with all the slots you want. We modify drivers to work with GEM for the cards we install and... whoo-hoo! We've got Atari computers again, more affordable than EVER, because parts are already available and cheap!

The only thing we need to do is modify: the BIOS, an Atari ST emulator to work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!) on a Pentium-class computer! In fact, if we played our cards right, people might ACTUALLY be able to run their apps on both the ST emulator and the new GEM! But we HAVE to rewrite as much as possible to optimize it for today's PC environment!

Sure sounds feasible to me and a LOT cheaper than trying to build a custom 060 or PowerPC board, plus modify the emulator and GEM to all that stuff. Not to mention the drivers... oy!

Now see what you clone-people have done? You've taken me from my grand classic Atari ST designs to this altered plan where there's very little difference between a new Atari and a standard PC! All in the interest of finding some way of getting Atari back!

I gotta get some sleep... stuff to dream about! Yeah!

Luposian

Ok, now that does make some sense :)

>how hard do you think it would be for me to
> actually get one? VERY! Not to mention that Atari headquarters has
> ALWAYS been in the US (California), that I know of.

Yes but I guess that would not be very important except for sentimental
reasons really, if you easily could buy a TOS-computer in the US, with
an english OS installed ;)

> But then, for the same reason(s), you probably DON'T want it in the
> US, which could be understandable.

To me it doesn&#65533;t matter where the company has its headquarters or the
computers are made. I just wish that they would be available to anyone,
no matter where they live. It seems to me that the people behind
TOS-computers that are available now could do a lot more to make them
available to people outside their own country.

It seems to me as if several german companies could do a lot to focus on
other markets than their own.

I would be more than happy if somebody managed to start up (a new) Atari
again, and make it work. Sure I&#65533;d be happy if they were located in US or
Germany, as long as I can get hold if the product without too much
trouble,

> P.S. Just remember, what you call TOS computers today, were taken from

hehe, I do not even own a clone. :) Still working hard with my 4Mb STe,
100% Atari Corporation stuff ;))

> Never forget that. Atari is why they exist

Yes of course, no need for us to argue about that! :)
I would not mind having the company back, but I would not want it back
just for the sake of it.

You know that you're now talking about Yamahas with a Kawasaki badge, and
that you're now talking against yourself... again? The above would be
applicable to Hades/Milan boards, and you would have all you need.
Computer Direct used Hades boards to build Direct T60's, so I'd imagine
you can use Hades boards (or Milan boards, as I'm sure theyd be
interested, if SERIOUS) to build Atari machines. So, now we're back to

"slap a Atari badge onto a Hades or Milan", which is much better than
"slap a Atari badge onto a common PC".

STOP IT, before it gets silly to the point where it explodes.

Apparently it has not sunk in that the hades and milan boards
are custom made. The term clone is so over used in the PC market
one could get confused seeing. However I stronglg feel this
chap has never see one, hense clueless.

Hold on a sec, have you researched Amiga? There is at least one
clone on the way "boxer" and is the amiga market really better?
Their idea is to sell a platform independent OS under the name
Amiga, with some silly slogan "In the spirit of Amiga".
A move like that says what? Forget the Amiga as you knew it.
So I say to you please read up on current events...

Sure it has slots, but to get some performance you have to
put nearly a computer in itself into an aging slot, one could
argue if it's even an Amiga at that point... it sure isn't
a card from Amiga but some third party.

Do not let that bother you until you actually find out for yourself. I
think Hasbro does not want the Atari name to have anything to do with
games, but computers are another thing. Do not give up yet. The one thing
to do is to ask Hasbro themselves....

Most of the serious development work, starting with the MEGA and
TT, was done by Atari Germany.

Have you read the textfile that comes with Rainbow2? It explains the
format very well, at least enough for me. But if you prefer asm-sources,
I can dig something out for you. The only thing I haven't tried is the
animation sequences which are also in the SPR-file.

Source record: 1738

I have a problem in LED, but only in this situation MagiCMac+NVDI, tought I didn't test much, it seems it has to do with the odd Mac resolution 832x624. Spaces and white spaces are filled black instead of white, I think there is something odd in the nvdi call vro_cpyfm at this resolution, the rcopy function is called to just fill a white rectangle, but with this call and the NULL addr parameters something goes wrong, so I changed the call with a vr_recf. Anybody knows about this ? Maybe I need to fill some other pf the MFBD parameters fields ? It works ok with the new function tought, I think I do not need the blitting call, but just to know why...

```
MFDB src, dst;

word *setxy(word pxy[], word x1, word y1, word x2, word y2)
{
pxy[0] = x1; /* linke obere Ecke */
pxy[1] = y1;
pxy[2] = x2; /* rechte untere Ecke */
pxy[3] = y2;

return pxy;
}

void rcopy(word xs, word ys, word ws, word hs, word xd, word yd, word mode)
{ word pxy[8];

src.fd_addr = dst.fd_addr = NULL;
setxy(&pxy[0], xs, ys, xs+ws, ys+hs);
setxy(&pxy[4], xd, yd, xd+ws, yd+hs);
vro_cpyfm(handle, mode, pxy, &src, &dst);
}
/* Mike 14 8 00 */
void rwhite(word x, word y, word w, word h)
{ word pxy[4];

setxy(&pxy[0], x, y, x+w, y+h);
vr_recfl(handle,pxy);
}

/*#define RWHITE(x, y, w, h) rcopy(x, y, w, h, x, y, 0)*/
#define RWHITE(x, y, w, h) rwhite(x, y, w, h)

Source record: 1739

Jared Falvo <luposian@mailcity.com> skrev:
: People want their TOS computers, right? They want their slots, right? They
: want it all, right? Well, so do we!

: What if (the new Atari) computers were simply modified PCs? You alter the
: BIOS a little, to allow for an Atari splash screen. You have an Atari ST
: emulator that boots first, unless you press a certain key to go into
: GEM2000! And since GEM was originally written for a PC, can you imagine how
: fast it would run on a Pentium-class (Socket 7 233MMX, mind you) system, not
: to mention a Pentium II/III, if optimized? Yee-haw!

I can imagine, since I have run a multitude of emulators. They are not
fast. If you want a fast ST clone, try MagiCMac on a PowerPC Mac. Horribly
fast!

: Sure, you could more or less do that already with a PC today, but assuming
: anyone cared about the BRANDNAME (unlike most people here, it seems), it
: still wouldn't be the same.

It still wouldn't be the same, brand name or not. The fuji sign won't make
the ST PC run any faster.

: We would have affordable, already-made PCBs with all the slots you want. We
: modify drivers to work with GEM for the cards we install and... whoo-hoo!
: We've got Atari computers again, more affordable than EVER, because parts
: are already available and cheap!

Sounds much like the TOS clones we have now.

: The only thing we need to do is modify: the BIOS, an Atari ST emulator to
: work in GEM (or even FreeDOS, if possible), and GEM to work (really fast!)
: on a Pentium-class computer! In fact, if we played our cards right, people
: might ACTUALLY be able to run their apps on both the ST emulator and the new
: GEM! But we HAVE to rewrite as much as possible to optimize it for today's
: PC environment!

Why modify the BIOS? There are a lot of BIOSes out there, and while they
are generally horrible, it would be a lot of work to modify them, and with
PC hardware, you really can't escape the bad qualities of the generic
BIOS.
Your other idea souns good, though. Reminds me of the effort to
reverse-engineer an open-source version of the AmigaOS, AROS
(http://www.aros.org/), providing full API compatibility. Seeing as the
Atari API isn't as complex as the Amiga one, considering the availability
of several TOS clones (here referring to clones of the actual TOS, not
clone computers running TOS), it should be quite feasible, albeit
requiring recompilation of programs unless a 68k emulator were

incorporated into the OS design.

: Sure sounds feasible to me and a LOT cheaper than trying to build a custom
: 060 or PowerPC board, plus modify the emulator and GEM to all that stuff.
: Not to mention the drivers... oy!

Drivers would be needed in any case? Do you think they are part of the
hardware?

: Now see what you clone-people have done? You've taken me from my grand
: classic Atari ST designs to this altered plan where there's very little
: difference between a new Atari and a standard PC! All in the interest of
: finding some way of getting Atari back!

How about helping the actual Atari scene instead of any of your grand
plans? I suggest you go along with the project suggested above, that of
writing an API-compatible TOS clone for PCs, and throw your hardware plans
out of the window.

Note that on palleted/indexed-color-modes (like the all Falcon
resolutions up to and including 256 colors), drawing an all-zero-bitmap
results in a white area, whereas on direct-color-displays (mostly 16 bpp
and beyond), this will produce a black area, as all-zero means "color
with index 0" for the first type of display (usually white), whereas it
means "RGB value of 0-0-0" (black) on the second type.

Thus, to fill a rectangular area with all white (or all black), use
vr_recfl() or - if you want to fill a memory area only, for later use,
use vrt_cpyfm() with a fully filled bitmap (i.e. all bits set) and set
the color indeces accordingly.

Ciao

Thomas

So is this an nvdi bug ? The vro_cpyfm should always fill the area with white
when using ALL_WHITE (that is 0) as wr_mode parameter value. At least this
is what is written in my Lattice C manual, and does not speak about color
indexes, will have a try tought, obviously the ALL_BLACK is 1 so I just have
to check....

btw, what's the last version and status of Thing ?

Ok you are right, I exchanged 0 and 15 in the RWHITE and RBLACK calls and all
is correct tought I think would be reversed on a screen of the first type,
where the vr_recfl call shoul work always, I also think there should be no
performance difference, on systems without blitter like MagiCMAc.

THanks again.

It's not a bug, it's a very good example of poor design. I'm afraid you
just have to work around it by using different fillcolours in non-indexed
and indexed modes.

The CPU is a 6502 (or 65C02 ?) I think. If you get the Atari800
emulator you'll find there the exact emulation for binary and BCD
including the calculation error the 6502 makes at BCD calculation.
The C source is at the end of file cpu.c and an 68000 assembler
source (partly written by me) you'll find in cpu_m68k.s .
I tested the results against the 65C02 of my Atari 800XL.
If you have further questions feel free to ask :)

Gerhard

vrt_trnfm() transforms a video specific bitmap to standard planes and vice versa.

Use standard planes for files. You wont suffer from the differences between
graphic display systems.

OK, so what is the fname in the INTIN vector? described as specifying the
GEMDOS file specification for the GEM bit image file to print. Is this an
input file that it will then print to the workstation?

Also if I open a memory.sys workstation can I use commands to "read" the
memory like a screen?

Or rather just a poor #define for the blit mode.
It should be called ZERO, or something like that.

Even in paletted modes, there is obviously no way to guarantee that
the colour is actually white, since someone may have changed the palette
(in every true colour mode I've heard of, you will get black, though)

>just have to work around it by using different fillcolours in non-indexed
>and indexed modes.

An even better idea (that has already been mentioned) is to use the
functions that are supposed to fill with specific palette indices, such
as vr_recfl().

There is no reason why there should be a difference worth mentioning
even on an ST with a blitter (not to mention any of the faster machines).

I guess Atari's VDI may be slow, but I'd be suprised if NVDI didn't use
some kind of MOVEM loop, which should be within a few percent of what
the blitter can do on large areas (and on small ones there shouldn't
normally be any performance problem in any case). The masking for the
first and last words on each line doesn't take very long.
Apart from people who don't own any replacement VDI, I doubt anyone
makes use of the Atari blitter these days, anyway. You usually turn it
off with NVDI, and fVDI doesn't support it at all.

Machines with decent graphics cards should do a vr_recfl() at least as
quickly as a ZERO/ONE vrt_cpyfm().

Hello Ben,

> I have also been looking at a program called ACS-Pro
> which looks to provide some form of visual design
> for GNU C++? Does anybody know more about this program.

Yes, I know more...
You can find the homepage of ACSpro at
http://www.atari-computer.de/martin_elsaesser/, but its only in german
(I had yet no time to translate it)... ;-/

Currently I am porting the libraries from Pure-C to GNU-C - it's C,
not C++... ;-)

If You have further questions, contact me: mailto:martin_elsaesser@atari-computer.de

Greetings

Martin

>>v_write_meta() will create a metafile.

Oops, v_write_meta() is used to send special opcodes to the metafile.
vm_filename() opens the metafile and standard output functions write
to it.

>OK, so what is the fname in the INTIN vector? described as specifying the
>GEMDOS file specification for the GEM bit image file to print. Is this an
>input file that it will then print to the workstation?

If you are talking about v_bit_image(), yes.

>Also if I open a memory.sys workstation can I use commands to "read" the
>memory like a screen?

Yes. You can "read" the image using v_get_pixel(), or just access
bit image directly (which is a lot faster). Note, opening a memory
workstation requires parameters not supplied by the v_opnwk() linkage.

What do I need to do to open a memory.sys file other than opening the workstation. Assume that I am quite familiar with opening and writing to a meta.sys file.

My interest here is in trying to create a bigger image so that I can create better .IMG files than simply converting the standard screen into an IMG file

Also perhaps you know the answer to the following.

When I try to get a bounding box for text on a meta.sys file I always get incorrect (really incorrect) value. I am using SPEEDO (I know I should convert but I am just fooling around with the Atari, my work is all done in a windoze world).

I think its best to leave trap #0 (and trap #15) free.
This follows the existing pattern. 1,2, ... ,13,14

If you think your dll system is akin to BIOS,XBIOS, use 12, otherwise 3.

This is pure intuition. No arguments. :-)

4339. Trap vectors

Newsgroup: comp.sys.atari.programmer
Date: 2000-08-18 16:21:43 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <8njo4v$n9d$1@news.comnet.co.nz>
Source record: 1658

Are there any reserved trap vectors on the ST beyond the ones used for calling GEMDOS, GEM, BIOS and the XBIOS?

My "Toolbox" DLL engine is currently using "TRAP #0" and I just want to make certain that it wont clash with anything else using that vector.

(I also have a strange recollection that an old Motorola 68k debugger used to tap into that vector)

4340. New XBIOS functions

Newsgroup: comp.sys.atari.programmer
Date: 2000-08-19 00:00:00 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <8nlffm$1jan$1@news.comnet.co.nz>
Source record: 1659

As part of the Toolbox DLL engine detection procedure, I have implemented a new XBIOS function, "xtlbxInfo()", which will return a true/false result, and fill in a buffer with info about the Toolbox DLL engine.

If memory serves, (I haven't done anything with that XBIOS-interface part of the Toolbox in a month or so, so I cannot recall the exact number) it is either function number 'tl' (0x744c) or 'tb' (0x7442)

Are these numbers "safe"? Do they collide with anything else?

Or would it be easier if I added a new 'TLBX' cookie to the cookie jar?

4342. CONSUMER ALERT - Beware of Eucalypt Software - Makers of Autopost & Rocketfuel!!!

Newsgroup: comp.sys.atari.programmer
Date: 2000-08-20 00:00:00 UTC
From: Warning-Warning@dryiiuwbft.com
Message-ID: <A66D638EB.vfnfdffhbse@chxe.gov>
Source record: 1662

Eucalypt Software - Makers of Autopost & Rocketfuel --- Ripped Me Off!!!
-
All potential buyers should be warned to steer clear of this company. They have a repeated pattern
of ripping people off and ignoring requests for support.
-
I know someone who sent in the $10 registration fee for Autopost TWICE (thinking the first one may
have gotten lost) and in both instances, never got a registered version of the program and all of his
emails were completely ignored.
-
I myself purchased Rocketfuel on-line and had to pull teeth to get an unlock code. The web site was very
quick to take my money, but no registration/unlock code came for days and days. I repeatedly emailed them,
only to receive nothing but autoresponses. After 5 days I sent them a message stating that if I did not have
a working version of the program by the close of business that day, that I would challenge the credit card
charge. Magically, the code arrived several hours later.
-
What kind of way to do business is that?
-
In any case, its academic... there are other products available for free that do virtually the same thing
and I only wish that I had known about them before I wasted my time with Eucalypt Software.
-
If your in need of automatic news posting software, there is nothing better than "NNTP Power Post 2000".
It's graciously been made available free from the following web site:
-
http://net-toys.8k.com/
-
Save your money... your time... and the aggravation!
-
Peace,
-
PPN
-
-
PS: I have no affiliation with the makers of PowerPost 2000.
-

Hi,

Can someone tell me how the MFDB structure works.
I mean how is organized the memory with graphic (mfdb.fd_addr).
Is point after point or first for example 8 planes for one point, then 8
planes for next point or ?
Is it byte or word or ???

As I know the vrt trnfm() call is unable to transform to a high color format.
But all/most Milans will run in high/true color (I think).

And I don't know how to convert to true color!
(read NVDI 4 or 5 documentation)

Hi Rafal

this is what my Atari Compendium says about MFDB:

[...]MFDB is defined as follows:

```
typedef struct
{
/* Memory adress (NULL = current screen).
If you specify a value of NULL, the
rest of the structure will be filled out for you */
void *fd_addr;

WORD *fd_width; /* Form width in Pixels */
WORD *fd_height; /* Form height in Pixels */
WORD *fd_wdwidth; /* Form width in WORDs (fd_width + 15) / 16 */
WORD *fd_stand; /* Format (0 = device specific, 1 = VDI format */
WORD *fd_planes; /* Number of Memory planes */
WORD reserved1; /* reserved (set to 0) */
WORD reserved2; /* reserved (set to 0) */
WORD reserved3; /* reserved (set to 0) */
} MFDB;
```

I hope that these Infos are useful for you.

Heiko

Alfred Arnold's AS should be the perfect match. It is available from
http://www.alfsembler.de - look for the unix C version, it should compile
just fine on a modern MiNT setup, probably on other compilers than gcc, too.

The NinjaForce Assembler and Lisa are both freeware and available on
the net. The ownership of Merlin is currently in question so you'd
still need to find a used copy of it if you wanted it. Orca/M is
available for both the 8 bit Apple IIs and the IIgs and are still
being sold by the ByteWorks.

Hi

There's Devpac 3 which caters for the Falcon, I haven't tried Devpac 2
but there shouldn't be problems.

Devpac 3 can be obtained from HiSoft in the UK: http://www.hisoft.co.uk/

Devpac3 is supposed to support the Falcon, You would probably find
"Modern Atari System Software" useful with it. Both were published by
HiSoft, I don't know if they're still available.

I've heard the annual sale and swap meeting of the Columbus,
Ohio, Atari club will be taking place on Saturday, September 9th.
Here are some details I've heard about this event:

Time: 9 am to 3 pm (Eastern Daylight Time)

Place: Oakland Park Community Center, 980 Lenore Street.

Location: Use East North Broadway or Cooke Road exits of I-71,
northeast side of Columbus.

Admission: $4 per person. (Maximum $8 per family.)

Hi

Some of you may have seen this in the journal of TT-Digger & AHCX

I thought it might be nice to give it to the public.
Basically because it is only in dutch.

I didnt want to translate it myself, because the naturality of the language is essential. Also because of differences in sentence order in languages it may be necessary to change the programming of the little generator.

So you can find it on my homepage (in sig) both as a ACC and source.

Because everybody understands english I need a english programmer who understands dutch to make the first translation. Then it can start conquering the world.

The stuff that needs translating is in TTIJD.C

Source record: 1685

Hi,

Been surfing the net, got lots of downloads, know about the Howard system (not much about what it is, but that it exists and is expensive) and about emulators (Like Handy/MacOS). I also have an Amiga 2000HD on order and may use it to develop with a Howard System and a Lynx. What I really would like to do is this

1. Have a Lynx around.
2. Interface it with a Macintosh G3 B&W and serial cables (or some type of communications cable).
3. Be able to download programs to the Lynx.
4. Use CodeWarrior MacOS and some type of extension for cc65 (some type of 65C02 C compiler)
5. Make this all work and have docs for the Lynx and its routines.

So, basically I want to use what I have now, a Mac B&W and tools that I have (CW and MPW, preferrably CW) and develope and download games to the Lynx.

Any thoughts, ideas or the like on how you have done Lynx Programming in the past are more than welcome and helpful.

Thanks!

Check out The Macroassembler AS at
http://john.ccac.rwth-aachen.de:8000/as/
This assembler takes a bit to get used to but it supports more CPUs than I even knew existed and it keeps adding more. Yes this assembler is currently in development and the tech support is good. It is free as well. I am using it to program the NES which uses a 6502 core and I will move to the Sega (68000 and Z80), and the SNES (65816). This assembler supports all of these processors and more, a lot more. The 2600 uses the 6508? It is also a 6502 core. Anyway, have fun. BTW the Atari can only address 8K of RAM/ROM (only twelve address lines). The standard 6502 can address 64K. Curious, what are you going to use it for?

Frank

Message-ID: <8pnjob$30dd$1@news.comnet.co.nz>
Source record: 1690

I've recently needed to get data input from a form using G_FBOXTEXT objects.

However, the data I need is a floating point number consisting of a differing number of digits and a decimal point. I cannot use a te_ptmplt of "___.____" and te_pvalid of "9999999", as this pre-supposes three digits and four decimal-places, which may not be enough for this application. (Reworking the text, inserting the decimal point and removing internal spaces before converting to a number can be a pain as well)

Unfortunately, there does not appear to be a te_pvalid character that I can use to allow this.

The nearest validation character to what I need is "P", but this also allows non-numeric and non-decimalpoint characters.

Is there some way of inserting myself into the AES "validate" phase and allow/disallow the entered keypress?

It's not the emulator that is slow, it's your ST. The ST is simply too slow to emulate most computers. All other Oric emulators (Amoric, Euphoric) require also systems much more powerful than a plain ST.

Atoric already uses an optimized CPU core (Assembler language) but it seems that the 68000 is more suitable to emulate the Z80 (Spectrum, ZX81).

It seems strange that it would be better at the Z80 than the 6502.

I've seen other emulators work on the ST so is the Oric a problem, or is it just the ST ?

>
> It seems strange that it would be better at the Z80 than the 6502.

I'm not an expert on CPUs. Maybe the way the Z80 works is more similar to the 68000. But I've talked with Christian a few times - he uses the 6502 core of the C64 emulator programmed by Uwe Seimet.
There's always room for optimizations but hardly enough to run at full speed.

>
> I've seen other emulators work on the ST so is the Oric a problem, or is it
> just the ST ?
>
There are about four emulators which work quite nicely even on a plain ST: Zx_Sp, ZX81, QLem and 2nd Life. All of them (except QLem) emulate a Z80 machine.
XFormer was the only 6502 emulator which was quite fast on a ST. But this emulator was very limited.

The problem is the ST IMO but the Milan is quite a nice Oric clone :-) (runs at full speed there).

Hi

I'm in need of as much info as I can get for the file format used by
Cubase. Especially if it has a header.

Many thanx

HMMMM...There are several file formats for Cubase: ARR/ALL/PRT/DRM/IPS
and even MID! Which one.???.not that I know anything about it! However
a "WHY" might be in order to see what you actually want.

Hi

Good point, not having used Cubase I was unaware of the range of formats
used:) The format I need is for the .ARR files.

Cheeers!

It's really old and can't compete with Pure Pascal (which is also more
Turbo Pascal 7 compatible).

There are also some fine GEM libs available for Pure Pascal so if you
want to do some serious Pascal programming try Pure Pascal.
Personal Pascal is fine if you just want to try out some things in
Pascal.

Hi Steve

I guess I am trying to understand what you mean by "format". For example: What is SAVED when you save an ARR file from cubase? These would include things like stuff in the Inspect window,patch changes, and sysex material you have on a track. Then you could taker several ARR files and put them together to form a .ALL file or rayher a song which contains many arrangemets.

Or are you talking about if you bring a file into TXT editor: what is there?

HMMMMMM...perhaps if you tell us WHY? Why do you need a "format" on ARR. then I can try to understand what you want.

Tim (thinking too much!)

What I'm after is the format the file is saved in: the header of the file and where/what the segments in the file are.

Very much like an executable program file has to be in a certain format for it to be run; the header which contains all the info for the data, bbs section etc..

I am trying to recover a disk that has nothing but .arr files on. It looks as if the .arr files have header or pointers for the various sections of the file; much like tracker mods etc.

If I can find the start of the file, I want to be able to work out the length (or be very close to it). I will then be able to try and suss out where the other bits of the file has gone, hopefully.

So in a nutshell I am after the header info that tells me where the relevant sections are leading to the total length of the file!

Hi steve

Looks more complicated then I thought. So have you have tried loading these into Cubase, and they do not load? Or are you somehow trying to convert them to midi files? If you want to zip them to me at tconrardy@hotmail.com I can bring them into Cubase and convert them. (which is he only way to convert a Cubase arr into a midi file) I did try taking an ARR file into a TXT editor to see what it looked like. Just code to me. I am not a programmer. perhaps you need a programmer. however, if the above is true, feel free to send me the files and i can convert it. If you have a PC, you can get GEMEXPLORER to read the files onto your PC HD.

Hope this helps a little

Hiya

No! what I am trying to do is recover files from a disk that has gone wrong. There are 2 files on the disk, one of which is quite simple as I know the length and start of the file. The other, on the other hand, I don't know the length OR start cluster/sector.

What I need to do is track down the header, start of the file, and try and suss the length out from the header (hopefully). I have already found the end.

I would presume the first few bytes of the file will give info on how long each segment is, whether it be the 1st track, 2nd track or layout, or an offset to the next segment.

There MUST be some documentation, or someone that knows, somewhere!

Dear Atari programmers,

I purchased my Atari 1040 STF a week ago, and now I wish to port the disk magazine engine to this platform.

To do this job I need a decent C compiler (or cross-compiler like gcc, if no good native compilers are present). Could you give me any recomendations? Ofcouse I am not able to pay for commercial product, because the project is non-commercial.

Any recomendations are very welcome!

Best regards,
Adrian

I found it on a CD but it was Christian Felsch's version (don't
remember his homepage at the moment). If you use mint you could
also try the newer 2.95.2 from Frank Naumann's page at
http://wh58-508.st.uni-magdeburg.de/ftp/pub/mint/programming
but that's quite some MBs.

Gerhard

4409. DragAndDrop Protocole [LONG]

Newsgroup: comp.sys.atari.programmer

Hello alls Atarians
and sorry for my disastrous English

I have a problem whith Drag and Drop
protocole. The folowing code derived
from (Alexander Lorenz)' sources,
compiled whith Pure C don't work correctly.
(Magic PC, NAES Falcon, MagiC Falcon, tested
and the problem is the same)

With my code as receiver whith this senders:
Jinnee, Cab, all is OK.
Qed 4.52 which use code from (Alexander Lorenz) don't work
(receiver (my code) wait for DD_TIMEOUT in Fopen() and return
handle -33 File not found).
my code as sender thereafter, don't work
(receiver (my code) wait for DD_TIMEOUT in Fopen() and return
handle -33 File not found though
file name is good !!!).
Luna the system freeze completly.

With my code as sender on this receivers:
Cab all is OK.
GCCShel which use code from (Alexander Lorenz) all is OK.
Qed 4.52 which use code from (Alexander Lorenz) don't work
(sender (my code) wait for DD_TIMEOUT in Fselect() and return
i = 0 and handle_mask = 0)
my code as receiver thereafter, don't work.
(sender (my code) wait for DD_TIMEOUT in Fselect() and return
i = 0 and handle_mask = 0)

I don't understand, bug in binding of Pure C ??? why receiver can't open
a file whith correct name ??? is the sender's file looked ???

Help me please
Roland

```
------------------------ Sender -----------------------------------
{BYTE pipe[24];
WORD mbuf[8];

I managed this once on a logic 2.0 song file
many years ago: it took days with a pencil and paper
and a hex sector editor.
Gemhexed I think.
Good luck ;-)

Hello!

> Is there anybody who has used gprof successfully?

Yes, I :-)

> I set the -pg option at GCC,

You also added -pg at the link stage? This is very important as otherwise
the normal startup module is linked and not the profiling startup module.

You use latest MiNTLib (0.55.3-4)? You have MiNT running?

Hi,

Is there anybody who has used gprof successfully ? I set the -pg
option at GCC, the function main of my C program terminates with
'return 0' but after running my programm I don't find a gmon.out
(nor any other new file). What else can be wrong ?

Another question is whether anyone could point me to some infos
related to 68030 asm optimization. I already have the original doc
from Motorola and a several years old file about optimization
written by artTBL. Any other doc where I could get new ideas ?

And finally, is there somebody willing to share his/her Falcon
256 color mode asm sprite routines ?

Thanks
Gerhard

4419. Re: TIFs and Demon's DFAX service

Newsgroup: comp.sys.atari.programmer
Date: 2000-10-08 23:40:46 UTC
From: augeas@elis.demon.co.uk
Message-ID: <39e114e440c4480@elis.demon.co.uk>
Source record: 1638
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

X-posted to comp.sys.atari.programmer...

The Prologue:

I've been trying to make sense of the .TIFFs spewed out by
Demon's D-FAX service. Now read on...

on Sat 30-09-10 13:14 John Whalley wrote:

>"G. R. Greenway" <augeas@elis.demon.co.uk> wrote in message
>news:39d38c541b36c50@elis.demon.co.uk...

>> >and then at least know what we are dealing with.
>>
>> GEM-View spits out: "unknown data compression algorithm 0 (0x4)."
>
>Can't help with the header, but FWIW, they are multi-page CCITT TIFFs,
>apparently a format designed for faxes. This question has been raised a

I was getting quite determined to nail this problem, so I
started throwing some C together. The .tiff file I've been working
on has 17 12-byte image file directories (IFDs), here they are:

Number Tag Type Count Offset
0 256 3 1 1728
1 257 3 1 2282
2 258 3 1 1
3 259 3 1 4
4 262 3 1 0
5 266 3 1 2
6 273 4 1 8
7 274 3 1 1
8 277 3 1 1
9 278 4 1 -1
10 279 4 1 4563
11 282 5 1 4782
12 283 5 1 4790
13 284 3 1 1
14 296 3 1 2
15 297 3 2 65537
16 305 2 9 4798

The third tag, 259, indicates the type of compression. Like
GemView said, this has a value of 4, completely undefined in the
tiff 6 spec. Gemview also agrees on the dimensions of the image,
1728x2282. Tag 9, 278 indicates that the whole page is expressed
as one strip. Tag 6, 273, has an offset of 8. This is ludicrous,
as it's meant to point to the compressed data of the 1st strip.
Both the tiff 6 spec and the tiff class F spec that deals with faxes
can be found at:

ftp://ftp.faximum.com/pub/documents/

There's no mention of what a value of 4 for the compression
tag could mean, and I've no idea what happened to the strip offsets.
Does anyone[1] want to help with the fight ?

"Augeas"

Mario, still want that .tiff file ?

I admit I didn't look close enough at the linker options. Sorry :(

But now my problem is replaced by another one. I got a gmon.out
of approximately 200k but when I say

gprof myprogname > reportfile

gprof says no error but also creates no report file. Any idea
what I did wrong this time ?
Is there any way to check whether the gmon.out is okay ?

Thanks for helping me up to here
Gerhard

Oops again, this really is a case of RTFM. It just means
CCITT with knobs on. They _aren't_ class F tiffs, but they're not
baseline, either. This thread may not bode well for my chances of
success, but I'll see if i can write something that will chop them up
into .img files. See you later. _Much_ later....

Oops, not only did I post this twice, but the value of 8
isnt ludicrous, just rather peverse. The data starts from the 8th
byte, just after the header, with IFDs tacked on the end. Strange,
but legal. Still no idea what a value of 4 for compression means,
though.

This is an very old gprof version. If you use gcc 2.95.2 and the binutils
2.9.1 you must use the gprof from this packages too.

Since I failed at installing 2.95.2, I think mainly because I
couldn't get rpm to work and fileutils and sh-utils unfortunately
only exist as rpm archives, I'm still using 2.8.1.

I didn't try the gprof from binutils 2.9.1 with the 2.8.1 generated
files because I was sure it wouldn't work, or would it ?

There are also tar.gz versions of the gcc, binutils, mintlib.

> I didn't try the gprof from binutils 2.9.1 with the 2.8.1 generated
> files because I was sure it wouldn't work, or would it ?

No, if you update you must update all things. About the older gprof I
can't say much as I never used it for more than a test (and the test
failed).

Yes. I downloaded them but somehow the system didn't work as it
should. Maybe because the makefile called fixstack and I didn't
notice then that I should change that to a call of stack.
Then I believed I need fileutils and/or sh-utils and they were
rpm.
But I will try again in the next days to install 2.95.2, hopefully
without the need to ask lots of questions in the process ;-)

Thanks a lot
Gerhard

The new system siginifcantly differ from the old tools. Don't expect that
old projects work without small corrections.

> Then I believed I need fileutils and/or sh-utils and they were
> rpm.

With rpm2cpio & cpio you can easily unpack it from hand.

Hello There
For some time I have had startup problems on my Falcon 030. When I switch it on
the Harddisk and the rest of the machine doesn't start. If I press the reset button for
5-10 seconds the machine normaly starts, but some time I have to switch the Falcon and
press the reset button a lot of time to get the machine to life.
What's wrong ???

I have had the machine for 6 years now, but it is only the last year this problem has appear.

Thank, Preben Sloth

Please reply to ps@lkps.dk

Message-ID: <39E65597.9B4DB9E1@ihug.co.nz>
Source record: 1551

Hi there,

I'm trying to write a small C program to convert
X-IMG graphics to some format of icon, so that
I can load these icons into programs like the
wonderful ICDRAW 1.42, by Dr.Bob.

The biggest hurdle is finding the spec for the
X-IMG format, which despite an hour or 2 on the
the net I have miserably failed to achieve!

Does anyone know of a site that has a copy of the
X-IMG spec on it? This is all I need to get moving
on this project. The .ICO format spec was easy to
find so that side is a piece of cake...

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Always seem to be pimping this ;) If you grab the boinkout2
sources from my site there is a set of C routines for reading an (x)img
file into an MFDB. While it's not a spec description, it might save you
some time.

I've had the same problem a few times. Loose socketed chips have been
the suggested culprit, but I haven't opened her up to be sure.

Good luck with your search.

September 7, 2000 at 09:39:07:

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY.

HOW TO TURN SIX DOLLARS INTO SIX THOUSAND:

: READING THIS COULD CHANGE YOUR LIFE! IT DOES WORK!

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you

: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1) Steve Wehvila
: 3155 Vernon St.
: Duluth, MN 55806

: #2) Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #3) Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #4) Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #5) David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #6) Webster Lessard
254 Clarks Mills Rd.
Hollis, Maine 04042

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and

: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,
: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that

: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

Hi!

John Kormylo <elfsoft@mindspring.com> wrote:
> The easiest way is to call Vsetmode() (requires v1.1).

IIRC, you can simply use something like this with Pure C 1.0:

#define Vsetmode(a) xbios(dontknowtheopcodeofvsetmode, (a))

Or write your own assembler module - not a big deal, IMO.

Ciao

Thomas

OK. Vsetmode should works correctly, but...
Should I make some speciall magic tricks before to use it?
I have also problems using Vsetmode under ScreenBlaster, is there any
solution?

```
Hi,

I have written a piece of code that looks like :

JumpFrom:
jmp ([JumpTable-JumpFrom-4.b,PC,d0.l*4])
JumpTable:
dc.l Target1,Target2,...

Target1: some code
Target2: some more code
...

The advantage is that it doesn't need an extra address
register and is faster than any other method I tried.
When I assemble it with the Pure Assembler it works very
fine but when I assemble it with DevPac 3.10 although I
set the option to 68040 and in the DevPac manual it is
described to be working from 68020 up I always get :

Error : relative addressing not allowed

I tried every variation I could imagine but it's no use.
Unfortunately I need GST format output of that module
and therefore can't use the Pure Assembler.

So can anybody tell me how to write that code so DevPac
accepts it or is there a bug in DevPac preventing the
use of PC relative addressing modes ?

Thanks
Gerhard

First: Pasm doesnt assemble this exemple correctly.
I was made aware of the fact by Ronald Andersson when he used TTDigger.
Being a Pasm user, I made the same mistake in TTdigger.

This may the reason why you did the subtraction yourself
because
jmp ([b,pc,d0.l*4])
should be good enough (if Pasm wasnt wrong! :-)

Basicly Pasm says: OK if you want to do my work (the subtraction), I dont mind.

Second: Your subtraction could be the reason why Devpac complains.
Nobody seems to be perfect.

There are 2 solutions:
use Pasm and write
jmp ([4,pc,d0.l*4])
or
use Devpac and write
jmp ([b,pc,d0.l*4])

PS the last public version of TTD (6.1) still has the error.
I have version 6.2 that fixes this, but couldnt be published because of
a related, not yet solved, problem.

4446. Modifying Atari 8bit OS

Date: 2000-10-20 00:00:00 UTC
From: Atari History Webmaster <webmaster@atari-history.com>
Message-ID: <39F101DE.A8B3D9C9@atari-history.com>
Source record: 1565

Hi,

I would like to add some device drivers into the Atari 8bit OS, can anyone recommend a good assembler/disassmbler for the PC or is it better that I just use something like Mac/65 on the 8bit itself, save it as a file and burn it to an eprom???

I appreciate the help, thanks.

Curt

Hi!

I've e-mailed the maintainer of WinSTon, offering to help with MIDI support for Windows, but never got a response. So I'm posting here to see if anyone wants my help or knows where I can offer to support Winston, and I'm also posting to ask for anyone who knows about the Atari ST side of things MIDI-wise (because I only know about programming MIDI under Windows, hardware and software (ie, which port is to beemulated)..

Hope that's clear enough!

Jeremy.

Sorry, this bit:

> MIDI-wise (because I only know about programming MIDI under Windows,
> hardware and software (ie, which port is to beemulated)..

Should say:

> MIDI-wise (because I only know about programming MIDI under Windows). If
anyone can help out with the Atari ST side of things, hardware and software
(ie, which IO port is to be emulated) than that would be great.

D'uh! Damn newsreader.

Jeremy.

Hi Jeremy

Thanks for your OFFER and I hope someone listens as this is DEARLY NEEDED to be able to run Atari Midi Apps on a PC (under emulation of course) There are some Atari-Midi apps that cannot be reproduced for Windows like Dr T's KSC Omega II with PVG.

I am just Encouraging you and anybody here that does Atari Emulation for PC, that this is a need.

BTW...for the Mac platform, I am happy to report that NoSTalgia DOES work for Midi. You really have to "tweak it" though.Harry Koopman (Of Midijoy) has tested it for us on Atari-Midi Egrp.

Tim

NoSTalgia supports Midi via Quicktime (Midi OUT) or OMS (Midi IN & OUT)
but some applications are not (yet) working.
Note that the current version of NoSTalgia (0.7) has a bug preventing
Midi apps to run.
Version 0.71 is planned next week.

Enjoy !

The first thing that strikes me here is that your offset calculation has
a trailing ".b", which Devpac thinks means "byte". This '020+ addressing
mode only allows word and longword offsets.

Also, why don't you use "jmp ([JumpTable,pc,d0.l*4])" ?

AFAICR, it is analagous to
lea JumpTable(pc,d0.l*4),a0
jmp (a0)

I haven't used that addressing mode very often in the 8-odd years I've
owned a TT

A lot of us would love this, but as the midi timing even on native PC
programs is appalling I can't imagine what it would be like on an emulator
sat on top of windows.

Get real!
Most studios around the world actually DON'T use Ataris, believe it or not.
You don't have sample accurate sync on an Atari - but with a real midi
interface on a PC you have it there - so nowadays, a PC is even better for
midi applications than an Atari machine...
The main reason for midi timing problems is when people try to use crappy
gaming soundcards for midi - and that's impossible to use other than as a
toy! This is not a general problem in the PC, but a problem within the
soundcard!

Agreed.

(BTW: "analogous" means "similar to", not "the same as")

Register A0 would not be referenced, used or altered in my suggested alternative. I simply used a "load address, jump indirect" to show the mindset behind my alternative. Perhaps if I'd used a blatantly illegal register in my example (like R0 or A8) then there wouldn't have been this mis-understanding

Hi folks,
I need someone to make a small alteration to a old unsupported item of
software (STOS 3D).
Basically this software has some preset values for a certain function and I
want these removed from the main body of the program and placed in/read from
a text file so that users can alter them for each project they write by
simply changing the contents for the file.
The file contents will be 15 set of 3 numbers.
I will check this group over the next few days for any responces but if you
would like to help please e-mail me directly.

Thanks,
Stephen Moss

You're right. The code didn't look like that at my first try but
since it didn't work I altered it until Pasm did what I wanted it to
do, thinking it had somehow been my fault although I couldn't
understand why.
So many thanks, there's absolutely no chance I would ever have found
out what really caused the troubles.

I find this very interesting. I know gas, Pasm and DevPac and
every one of the three wants this a bit different. DevPac seems
to be the only one of them that does the subtraction without me
writing it there. But anyway it works fine that way. Thanks !

> AFAICR, it is analagous to

Well, it's a good alternative to

lea JumpTable,An
jmp ([An,Dn.l*4])

except when you have enough registers and can leave An unchanged
for several times looping over the jmp.

I admit one shouldn't use these modes if there is a slight
chance that the program would work on a ST too otherwise, but
the program I'm working on runs at ~5% of the needed speed on
an unenhanced Falcon so it makes no sense trying to run it on
an ST :(

Gerhard

I would suggest you to use a midi interface that's separated from the soundcard itself - either an USB- or serial port-interface. Otherwise, it probably won't give you the performance you're after, due to the internal handling in the soundcard. All combined cards I know of have the audio as the main priority, so midi always comes last... As for audio latency - how about my RME Hammerfall's 1.5ms...? ;) My midi interface is a rack unit from Opcode that connects to the serial port. I never have even the smallest glitch or problem with midi or audio - just the superb sample-accurate sync I want :)

Hmmm. Pasm does the subtraction, the problem is it takes the wrong pc value.
2 bytes short of the correct value.
In the manual it says "PC is the address of the extension word"
question was: which one?. :-)

Thanks, but I already know about it, besides it's STOS 3D I want to mess about with not STOS the Games Creator, I have tried tracking down the authors of the 3D extension but nobody knows what happend to them or the source code.
I have managed to disassemble it into source code, the problem is that I don't understand it, never could get the hang machine code.

Hi,

just wondering which is the most powerful between the Falcon and TT
since they are both based on the same processor.

cheers,
Marc

The TT has a 32-bit bus and a double-clocked CPU, so in this respect it's
a lot more powerful than a Falcon. The Falcon has much better graphics and
16-bit stereo DMA-sound though.

> though.

Not to forget its DSP, which enables the Falcon to do things the TT
won't manage, like playing MP3s at a decent speed. Of course, you need
special software that supports the DSP.

Ciao

Hi there,

Marc Wilson wrote:
>
> Hi,

> since they are both based on the same processor.

Thats where the similarity ends...

A standard Falcon clocks its 68030 CPU at 16MHz, while a standard TT clocks in at 32MHz. The TT also has faster RAM access, due to wider (full 32-bit) access to memory. The Falcon system bus only uses I think 24-bits of the full 32-bits bus to access memory. Even if the Falcon CPU was clocked at 32MHz (mine is), the TT will still run ordinary software faster due to its memory access advantages.

If you use the DSP in the Falcon however the table turns somewhat. As an example I've timed depacking of JPEG image files on an STe, Falcon, and TT. The Falcon depacker used its DSP and was about 50 times faster than the STe, and several times faster than the TT.

Other aspects draw comparison too, with the TT losing out on graphics and sound capability to the Falcon.

Both are still good machines, but the overall feel of speed would go to the TT I believe, with the Falcon winning on graphic and audio stuff...provided of course you are talking 'standard' machines, as both can be upgraded significantly!

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

Hi,

Recently I have been wondering if there is a way to unhide windows that has been previously hidden by the AES? (Any more AES than NAES support WINHIDE?)

I guess it is possible to just move the window back into the desktop area, but that will confuse the AES from what others told me. Now, is there any way to do this with AES calls?

from what i know, GEM is not open source.
you'd be as well to legally reverse-engineer it and write a spec, get
someone else or more people (for legal reasons) to write something
compatible and similar to GEM but modify it for the PowerPC's different
RISC architecture.

If the rez is say 640x480 it moves it to x:656, y:512 or something
close to that. Just off the bottom right somewhere. I made
some tests which dumped the coordinates from the move msg.
Someone may find that interesting to know. :-)

His problem is not so much where it puts it, but is there a legal
way to move the window back to the visible area? Take for example
an icq msg appears whilst the window is hidden and there is an option
to make the window pop back on screen. However from my tests
if you move the window yourself it seems to confuse either the AES
itself Thing, and/or Taskbar in my tests as I don't know how it works
beyond the move msg. It places an "*" next to the hidden apps, but
if you move it yourself then these marks become messed up.
If that helps...

>
Well Curt, I think that the idea of using Mac/65
might be the smoothest way to get the Atari to
recognize the new programming.

However writing the device driver on a PC
using a good assembler/disassembler will create
a driver that will recognize most equipment that
actually is based on a 16/32 bit structure of today.

The data crunching will bring about the headaches
when you try to make either a 16 bit device or a
32 bit device work on an 8 bit computer system.

You don't need to hack the O.S. to add a device driver. If the device is SIO or ram based, just write the driver code, using the entry points detailed in many Atari advanced programming texts. The driver loads into ram and adds its name to the driver name list. "De Re Atari" is a good place to start. "Mapping the Atari" is the book to have. Note that PBI devices get a little more complicated, usually needed a eprom for the code.

Also note that Atari 8 bit questions are best posted at comp.sys.atari.8bit.

If you are talking about the graphical parts AES and VDI then oVDIsis
and oAESis do run on PowerPC, but if you are also talking about
GEMDOS, BIOS and XBIOS then I am not aware of such an effort. If
someone ports the latter then it should be possible to use oVDIsis and
oAESis for the graphical parts.

1) Get an emulator. I suggest either PaCifiST, or WinSTon (or one of
its successors, known as STew)
2) Get MAKEDISK. This comes with the full distribution version of
PaCifiST, but is available separately.
3) Use MAKEDISK to read your ST disk images into a .ST image file.
4) Use these image files in one of the emulators.

From: J Wilkinson <jwandjw@ihug.co.nz>
Message-ID: <3A05E6EE.2C17A414@ihug.co.nz>
Source record: 1516

Hi there,

I'm looking for help with Hisoft BASIC...

I've looked on the Hisoft web-site but they don't appear
to support or sell it anymore (I could be wrong!). I've
only got a coverdisc version of v1.23, but never got round
originally to ordering the docs or upgrading via the mag
to v2.

Some of the more curly syntax is starting to test my memory
so what I'm looking for is a doc with a syntax descriptor
for GEM/AES event handling, also more precise instructions on how
to hook into RSC files, and recognise mouse events in relation
to actions on said RSC files...

Is such a thing in existence, or has the boat sailed too long
ago! :^{

Kind regards,

Chris Wilkinson, Christchurch, New Zealand.
/|\ ATARI Falcon030 owner.

Actually *original* GEM *is* open source! All Digital Resarch's intellectual
property was acquired by Caldera a few years ago. Original PCDOS GEM was
GPL'd and is available at www.deltasoft.com

Of course, this does not apply to TOS version.

From: Dominique Bereziat <bereziat@eddy.inria.fr>
Message-ID: <rw51ywppfbp.fsf@eddy.inria.fr>
Source record: 1519

Hi,
a new version of LDG (version 2.00) is avalaible at

http://ldg.atari.org/

LDG is a TOS based system allowing GEM applications to
load and share dynamical libraries. This last version is
really faster than previous one (version 1.20).

The package provides a GEM installer and a developper kit
for Gcc, Pure C and Sozobon C. However, it is very simple
to use LDG for other language (as explained in the
ST-guide documentation of LDG).

Have fun

I disagree. This isn't comp.sys.atari.ST.programmer. It should be shared
by both 16 and 8 bit programmers. After all many ST programmers probably
started with the 8 bits, and probably still have info to share.

Cheers!

James

A guy called Matthew Bacon can supply you with Hisoft BASIC 2
and he also runs a Hisoft BASIC WEB Site. The site is currently
unavailable but will be back online soon:

http://www.cadenza-software.co.uk

If you e-mail Matthew directly, I'm sure he can help you out. :

Yes, but there's (arguably) more 8bit experts in the 8 bit area than
here, non-specific though it is.

Not at present. I'll be looking at putting it up on a web page shortly.

(Earlier versions are floating about, but are generally
incomplete/incompatible)

The interface to the Toolbox is a TRAP based one, mimicking the
GEMDOS/BIOS/XBIOS interface, requiring no interface libraries to be
linked in to the application (a la GEM AES/VDI calls).

For example, here is a "Hello World" app (written in C and assembler)

#include "0/types.h" // typedefs "sint16" etc
#include "0/tlbx.h" // toolbox interface/typedefs

#include <stdio.h>

int main( void )
{
sint16 libhandle; // library handle, negative = failed to load
TlbxInfo tinfo; // info about the toolbox
LibInfo libinfo; // info about the library loaded

if( xtlbxID( sizeof( tinfo ), &tinfo ) != 'tlbx' ) {
printf( "No Toolbox\n" );
return -1;
}

if( (libhandle = tlbxLibLoad( "libname.tll", sizeof( libinfo ),
libinfo, NULL, 0 )) < 0 ) {
printf( "Cannot load library\n" );
return -2;
}

// you could examine the library loaded, and act accordingly here
// however, we'll just be simple, and assume it's OK if we get a
good handle

printf( "Hello, %s\n", libWorld(3) );
```

```
tlbxLibFree( libhandle, &libinfo );

return 0;
}
```

Now the same thing in assembly language:

(I've written this while online, so please excuse any typos/problems
[OE5.5 isn't ideal for entering source code])

```
main:
link a6,#-size
move.l d7,-(a7)

pea tinfo(a6)
pea tinfosize.w
move.w #'tb',-(a7)
trap #14
cmp.l #'tlbx',d0

pea libinfo(a6)
pea libinfosize.w
pea libname
move.w #$14,-(a7)
clr.w -(a7)
moveq #0,d1
trap #0
tst.w d0
add.w #2+2+4+4+4+4+4,a7
bge.s ok2

pea noload
jsr printf
moveq #-2,d0
addq.w #4,a7
bra return

ok2
move.w d0,d7

move.w #3,-(a7)
move.w libWorld_funcnum,-(a7)
move.w d7,-(a7)
```

```
moveq #0,d1
trap #0
add.w #2+2+2,a7
move.l d0,-(a7)
pea hellostring
jsr printf
addq.w #4+4,a7

pea libinfo(a6)
move.w d7,-(a7)
move.w #$16,-(a7)
clr.w -(a7)
moveq #0,d1
trap #0
add.w #2+2+2+4,a7

moveq #0,d0
return
move.l (a7)+,d7
unlk a6
rts

notlbx
dc.b "No Toolbox",10,0
libname
dc.b "libname.tll",0
noload
dc.b "Cannot load library",10,0
hellostring
dc.b "Hello, %s",10,0

Based on some feedback I've got, I may be changing the interface from
push args
push lib func num
push lib handle
move magic into D1 register
trap #0
fix stack

into something like this:
push args
push lib func num
push lib handle
trap #(3? or 12? or ?)
fix stack

as there no longer appears to be a need for a "magic" number when
calling the Toolbox. (It used to be useful in the earlier days, when
there were multiple versions of the Toolbox, and many differing ways of
passing parameters)

4506. Toolbox DLL manager

Newsgroup: comp.sys.atari.programmer
Date: 2000-11-10 07:10:38 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <8ug7gt$qd3$1@news.comnet.co.nz>
Source record: 1523

I've been doing a bit more work on cleaning up the DLL manager I'm writing.

As part of the process of making it more programmer friendly, and making it more widely used (and usable), I was wondering what features would you like it to have?

It runs as an AUTO folder TSR at system boot time, and consumes about 32k RAM.

At present, it has the following function calls:

Detection of the Toolbox:
An XBIOS function call that returns information about itself.

Library Enumeration:
There are library enumeration functions available (LibFirst, :LibNext) which allow you to get info about all libraries currently loaded, and can be used to implement your own "find library" function.

Library Search:
There is a LibFind function which will look through all currently loaded libraries to find on with a matching name, and return a true/false result, and info about the library, if found.

Library Load/Free:
The Toolbox will load a library given its filename, and return a handle which is used to call functions within the library. If a library is already loaded, it will "link" to it, and return a different handle. To unload a library, simply call the LibFree function (the library will only be fully unloaded when all users of the library have called LibFree)

Library File Info:
Ou can get info about a library file on disc by calling the LibFileInfo function. This will return info such as name, version, toolbox/processor requirements and so forth.

Are there any other features that would be of use that I have omitted?

4508. Re: MFP: Timer A?

Newsgroup: comp.sys.atari.programmer
Date: 2000-11-11 00:00:00 UTC
From: Patrice Mandin <pmandin@caramail.com>
Message-ID: <rb6ku8.5m.ln@manoir>
Source record: 1528

In the article <7peurdr8s9B@basedrum.de>, skwit@basedrum.de (Christian Wiesner) typed with his little fingers:

> while testing, there came up some other questions, maybe someone could
> answer:
> - does timer A run continuously when once started?

Timers A and B have event-count mode and delay mode.

The event-count mode triggers the interrupt when an event occurs.
For Timer A, it is end of DMA sound on STE machines
For Timer B, it is end of video line.

The delay mode is the "frequency" mode, where the interrupt triggers
after a programmed time, continuously until stopped.

> - if not, do I have to free the irq? (using xbios $1b, JENABINT etc?)

To do things clean, you should save each Timer state before modifying it.
Then, when you have finished using it, restore previous values.
It is necessary because you do not know which program or system can use
it, even if STE machines do not use Timer A by default.

> - when I use IRQs, do I have to save (and restore) an/dn manually?

In a interrupt routine, you must save all registers you modify, because the
interrupt can triggers anywhen in your program, so if you have a main loop
in your program and you do not save registers in the interrupt, do not ask
yourself why things are going wrong.

Hi everyone,

I'm having a few problems with Clink supplied with Lattice. I'm a new comer to Lattice let alone C so dont bite me head off!

Now I'm sure this is a very simple answer but I can't figure it out.

I have a piece of code like this to see what has been given to find the programs command line:

```
#include <stdio.h>
#include <stdlib.h>
#include <aes.h>
char *app,*cm;
main()
{
shel_read(app,cm);
printf("The application name was %a and the command line passed was %b\n",app,cm);
return 0;
}
```

I get an error like this:

```
<<<stuff here>>>>
Undefined symbols First Referenced
_shel_read File 'I:\PROGRAM\CODE\COMMAND.O'
<<<<more stuff here>>>
```

That is the programmes main problem. How much of Lattice do I need to set up, from a fresh installation? It's all rather confusing, but I really need to know C. The manual doesn't seem to help very well.

TIA.

Thanks Mario, you've found the problem I've been having with Clink
but.....the program crashes with two bombs! ARRRGGHH!!

So I need yet more help. When the program was compiled with out
linking as a GEM app, I clicked on the default.TTP and the printf
statement was displayed but with the %a and %b, but I suppose this was
because it wasn't using the shel_read command.

Another thing is, the message was displayed twice, not sure why.
```

Now when it is compiled and linked as a gem app, if I execute default.prg as a prg (or a ttp for that matter) I get two bombs and no message.

Anyone help.....please??

No, to print strings you must always use %s :-)

Of the other I know nothing, I dont have Lattice.

Changing %a or %b to %s doesn't seem to have made any changes
unfortunatly. If this helps at all it bombs with 2 bombs with Lattice
C (or possibly Magic) reporting TOS error #69.

Sorry I can't find my error codes...it was somewhere on my HD.... :(

If the only "undefined symbols" are names of GEM procedures, then it'd be that you're not linking in the GEM libraries. If there are any other names in the list of symbols, then you may not have your linker path set.

I'll assume that it is simply that you're not linking as a GEM app.

If you're using the integrated environment supplied with 5.60 (and 5.52?), look at "Executable" under the "Options" menu. Within that dialog, ensure that the "Build GEM app" option is selected. Then relink the app (select "Link" from the "Project" menu)

However, if you are using the linker from the command line, you'll need to tell it to link a GEM app. Check the manual chapter dealing with the Linker (in volume 1). Sorry, I don't have the manual handy, so cannot be more specific (I think this will be either adding an option to the command line, or naming the GEM library in the list of files to be linked)

Ok, I had a better look at your example (must do that always :-)
shel_read is a AES call.
You can only do AES calls if you are a .prg and you call appl_init first.

Keep the %s !!

```

About printf:

It is not a macro, but a real procedure.
%a .... %z are NOT argument numberlike things.

%d 16 bit word --> decimal
%ld 32 bit word --> decimal
%s string
%x 16 bit word --> hex
%lx 32 bit word --> hex
%c the character in the least significant 8 bits of a 16 bit word

to name a few

However, if you are running a 32-bit system, then

%d 32 bit fixed-point integer
%hd 16-bit fixed-point integer
(Some 32-bit systems also use "%ld" for 64-bit fixed-point integer)

... and likewise for hexadecimal values.

Some (most?) also use "%x" vs "%X" for lower-case vs upper-case
hexadecimal values. (ie decimal value 27 becomes either "1c" or "1C")

I've assumed you've trimmed the example code you supplied, however if it is to use a GEM AES/VDI function, you should have called appl_init() previously - and don't forget to call appl_exit() before your program finishes!

%a and %b are not valid format specifiers within printf(). Based on the code you've supplied, you want to display strings, so "%s" would be more appropriate.

>
> Another thing is, the message was displayed twice, not sure why.

Can't answer this one - I haven't ever seen a need for shel_read in my code. If ever I've needed to recover the command line, I use the argc and argv values passed to main() from the startup code.

>
> Now when it is compiled and linked as a gem app, if I execute

No GEM initialisation (via appl_init) ?

> to name a few

Some corrections:

%d is an int
%ld is a long int
%hd is a short int

Same for x instead of d.

IIRC, the ANSI standard does not specify the bit numbers of short, int,
long, etc. The only thing you can be sure of is

short <= int <= long

For example, on a 64 bit machine, a long may have 64 bit, a short 16 and
an int 32.

But because too much code seems to rely on "long == 32 bit", most
compilers stick to that and instead offer a "long long" with > 32 bit
(64 most of the time).

Ciao

Hi!

Henk Robbers <H.Robbers@cable.A2000.nl> wrote:
> C'mon, this guy is trying to get a simple program running on his ST.

Yes? And because of that, it's not OK to give precise definitions?

> If I ask somebody the time, do I want an estiamate of the age of the
> universe?

No. But it's simply good programming practice to pay attention to details like that. Note, for example, that already with Lattice C (what he's using), %d is /not/ always 16 bit, but an int. Depending on the compiler settings in Lattice C, this means 16 or 32 bit. It's just Pure C that only knows of 16 bit ints.

And another example, why assuming something without checking the exact definitions can be harmful: A /lot/ of code out there relies on time_t being a 32 bit value, easily convertible to and from long.

That's true for most of today's systems, but such a time_t isn't able to represent dates beyond 2038-01-19, 4:14:07 a.m. Now some people say: "OK, no problem, let's simply make time_t a 64 bit value". That would be perfectly OK, weren't there so many programs relying on it being a 32 bit value ... Most of them will of course compile with such a new time_t, but will most probably fail at runtime.

Ciao

It could be because the pointers you're passing to shel_read() haven't
been initialised and probably point 0L, which would explain the 2 bombs.

Try replacing the:

char *app,*cm;

with:

char app[128],cm[128];

Another thing, you should use appl_init() before calling shel_read() and
appl_exit() before the program quits.

> represent dates beyond 2038-01-19, 4:14:07 a.m. Now some people say:

Using a signed 32-bit counter for the seconds since the start of 1970,
it appears to overflow shortly after 2145 million-ish seconds (ie 68.09
years) have elapsed (ie 1970-2037, partway into 2038). This also allows
representation of dates back to near the end of 1901, if my maths is
accurate

I recall there being talk some years ago about it failing when the most
significant bit became a '1' and hence was deemed to be negative. They
were going to redefine it as an unsigned 32 bit value, IIRC.

This would extend the failure/rollover date by another 68 years (to
February 2116, I think), but disallow pre-1970 dates.

Yes. And what's different here to what I've written?

> I recall there being talk some years ago about it failing when the most
> significant bit became a '1' and hence was deemed to be negative. They
> were going to redefine it as an unsigned 32 bit value, IIRC.

That would be a violation of POSIX, as POSIX states errors in calls to
time_t-related funtions are to be represented as (time_t)-1. Thus, if
you made time_t an unsigned 32 bit value, (time_t)-1 would actually be
(time_t)2147483648, a valid date. How'd you want to detect an error now?

Sorry - I didn't intend my post to come across as a criticism.

The preceding paragraph was what I was aware of regarding 32-bit time_t.
This would set the background for the following paragraph, where I ask
about them changing from signed to unsigned 32-bit time_t.

It's been a long time since I've needed any of the <time.h> functions
that use time_t, and I'd forgotten about that.

Thank you for correcting me on this point.

From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <8v5r2c$17an$1@news.comnet.co.nz>
Source record: 1545

I've been reviewing the contents of the archive containing my DLL manager, prior to its eventual release.

Within the archive, I have the Toolbox itself, source code to a Toolbox Loadable Library (TLL), an application that uses the Toolbox to load, use and unload the sample library, a few C header files used by the application and library, and a simple ASCII file containing details of the Toolbox API (how to detect/use the Toolbox and its libraries).

There is also a (fairly primitive) library enumerator accessory, which can also interrogate library files, and configure them. (It hasn't really been touched since about 1996-ish, apart from being recompiled to work with the recent Toolbox revisions)

Are there any other utilities or files I should include in the archive that you would find useful?

(To the person who suggested I look at the LDG library: I have downloaded the archive, and will be looking at it shortly. Hopefully it does not clash with my Toolbox)

Hi,

Is there any fast way to make color sprites in C?
I'm doing this in that way:
1. first I'm showing the background picture
2. I'm saving the square, where the sprite will be shown
3. then I'm showing the mask
4. then the sprite
5. when the mouse position is changed then I'm showing the saved square
and back to 2.

It works good, but the sprite flickers... :(

>Is there any fast way to make color sprites in C?
[snip]
>It works good, but the sprite flickers... :(

You can pre-construct an XOR mask to swap back and forth between
background and sprite quickly. XOR the background and the sprite,
then AND the result with the sprite mask. A ^ (A^B) = B and
B ^ (A^B) = A while A ^ 0 = A. This reduces the flicker caused
by separate draw steps for background, mask and sprite.

See vro_cpyfm() with wr_mode value S_XOR_D.

If you are really fancy, you can construct an XOR mask to move the
sprite in one screen operation.

Well, I'm drawing this ((backround and a mask) XOR sprite) in memory not
on the screen.
And it still flickers.
Maybe it woud be faster to draw the mask as a 1 bitplane picture (in
fact mask is a 1 bitplane picture).
Will it be faster? or maybe the assembler routine for calling vro_cpyfm
would be faster?

Since you already draw it in memory the only thing left to do in my
opinion is to wait for vsync before calling vro_cpyfm to put it to
screen.
Helped in some games I coded although I only needed it in falcon
256 color mode but it has its limits. Since you're wasting time waiting,
you at least have to prepare all sprites in memory to put all of them
out at once.

Gerhard

Two days ago I ordered 10 pieces of paper money from 10 different countries from a company called Perth Numismatics. Lo and behold they arrived today and they are very nice and colourful. They even have a bill from Antarctica. I didn't even know they existed. These are perfect for stocking stuffers or people who are hard to buy for. The website address is www.perthmoney.com
Good luck and Merry Christmas

Hi, I've been coding on the PC (demos) for the past 3-4 years starting with pascal, then C/C++ and then on to ASM, I now want to move to doing the same sort of thing on my Atari ST. Can anyone lend a guiding hand to getting started, and anywhere I can download a good compiler for C/C++/ASM.

TURN SIX DOLLARS INTO SIX THOUSAND QUICK AND EASY Guarenteed

READING THIS MESSAGE WILL CHANGE UR LIFE FOREVER

: I found this on a bulletin board and decided to try it. A little
: while back, I was browsing through newsgroups, just like you are now,
: and came across an article similar to this that said you could make
: thousands of dollars within weeks with only an initial investment of
: $6.00! So I thought, "Yeah right, this must be a scam", but
: like most of us, I was curious, so I kept reading. Anyway, it said
: that you send $1.00 to each of the 6 names and address stated in the
: article. You then place your own name and address in the bottom of
: the list at #6, and post the article in at least 200 newsgroups.
: (There are thousands) No catch, that was it. So after thinking it
: over, and talking to a few people first, I thought about trying it. I
: figured: "what have I got to lose except 6 stamps and $6.00,
: right?" Then I invested the measly $6.00. Well GUESS WHAT!?...
: within 7 days, I started getting money in the mail! I was shocked! I
: figured it would end soon, but the money just kept coming in. In my
: first week, I made about $25.00. By the end of the second week I had
: made a total of over $1,000.00! In the third week I had over
: $10,000.00 and it's still growing. This is now my fourth week and I
: have made a total of just over $42,000.00 and it's still coming in
: rapidly. It's certainly worth $6.00, and 6 stamps, I have spent more
: than that on the lottery!! Let me tell you how this works and most
: importantly, WHY it works... Also, make sure you print a copy of this
: article NOW, so you can get the information off of it as you need it.
: I promise you that if you follow the directions exactly, that you
: will start making more money than you thought possible by doing
: something so easy!

: Suggestion: Read this entire message carefully! (print it out or
: download it.) Follow the simple directions and watch the money come
: in!

: It's easy. It's legal. And, your investment is only $6.00 (Plus
: postage)

: IMPORTANT: This is not a rip-off; it is not indecent; it is not
: illegal; and it is 99% no risk - it really works!

: If all of the following instructions are adhered to, you will receive
: extraordinary dividends.

: PLEASE NOTE:
: Please follow these directions EXACTLY, and $50,000 or more can be
: yours in 20 to 60 days. This program remains successful because of
: the honesty and integrity of the participants. Please continue its
: success by carefully adhering to the instructions.

: You will now become part of the Mail Order business. In this business
: your product is not solid and tangible, it's a service. You are in
: the business of developing Mailing Lists. Many large corporations are
: happy to pay big bucks for quality lists. However, the money made
: from the mailing lists is secondary to the income which is made from
: people like you and me asking to be included in that list.

: Here are the 4 easy steps to success:

: STEP 1: Get 6 separate pieces of paper and write the following on
: each piece of paper "PLEASE PUT ME ON YOUR MAILING LIST." Now
: get 6 US $1.00 bills and place ONE inside EACH of the 6 pieces of
: paper so the bill will not be seen through the envelope (to prevent
: thievery). Next, place one paper in each of the 6 envelopes and seal
: them. You should now have 6 sealed envelopes, each with a piece of
: paper stating the above phrase, your name and address, and a $1.00
: bill. What you are doing is creating a service. THIS IS ABSOLUTELY
: LEGAL! You are requesting a legitimate service and you are paying for
: it! Like most of us I was a little skeptical and a little worried
: about the legal aspects of it all. So I checked it out with the U.S.
: Post Office (1-800-725-2161) and they confirmed that it is indeed
: legal. Mail the 6 envelopes to the following addresses:

: #1)Jeff Brookman
: 3415 Covered Bridge Ln.
: Charlotte, NC 28210

: #2)Wit Wichaidit
: 10912 Broad Green Terrace
: Potomac, MD 20854

: #3)Mike Schude
: 893 S. roanoke
: Gilbert, AZ 85296

: #4)David Freeman
: 11045 Harbour Springs Circle
: Boca Raton, Fl 33428

: #5)Kevin Kniceley
: 4029 Minard Rd. N.W.
: Dover, OH 44622

: #6)John Decowski
: 51 Walnut Hill Rd
: Derry, NH 03038

: STEP 2: Now take the #1 name off the list that you see above, move
: the other names up (6 becomes 5, 5 becomes 4, etc...) and add YOUR
: Name as number 6 on the list.

: STEP 3: Change anything you need to, but try to keep this article as
: close to original as possible. Now, post your amended article to at
: least 200 newsgroups. (I think there are close to 24,000 groups) All
: you need is 200, but remember, the more you post, the more money you
: make! You won't get very much unless you post like crazy. :)

: This is perfectly legal! If you have any doubts, refer to Title 18
: Sec. 1302 & 1341 of the Postal lottery laws.
: Keep a copy of these steps for yourself and, whenever you need money,
: you can use it again, and again.

: PLEASE REMEMBER that this program remains successful because of the
: honesty and integrity of the participants and by their carefully
: adhering to the directions. Look at it this way. If you are of
: integrity, the program will continue and the money that so many
: others have received will come your way.

: NOTE: You may want to retain every name and address sent to you,
: either on a computer or hard copy and keep the notes people send you.
: This VERIFIES that you are truly providing a service. (Also, it might
: be a good idea to wrap the $1 bill in dark paper to reduce the risk
: of mail theft.)

: So, as each post is downloaded and the directions carefully followed,
: six members will be reimbursed for their participation as a List
: Developer with one dollar each. Your name will move up the list
: geometrically so that when your name reaches the #1 position you will
: be receiving thousands of dollars in CASH!!! What an opportunity for
: only $6.00 ($1.00 for each of the first six people listed above) Send
: it now, add your own name to the list and you're in business!

: ---DIRECTIONS ----- FOR HOW TO POST TO NEWSGROUPS------------

: Step 1) You do not need to re-type this entire letter to do your own
: posting. Simply put your cursor at the beginning of this letter and
: drag your cursor to the bottom of this document, and select 'copy'
: from the edit menu. This will copy the entire letter into the
: computer's memory.
: Step 2) Open a blank 'notepad' file and place your cursor at the top
: of the blank page. From the 'edit' menu select 'paste'. This will
: paste a copy of the letter into notepad so that you can add your name
: to the list. Step 3) Save your new notepad file as a .txt file. If
: you want to do your postings in different settings, you'll always
: have this file to go back to.
: Step 4) Use Netscape or Internet explorer and try searching for
: various newsgroups (on-line forums, message boards, chat sites,

: discussions.)
: Step 5) Visit these message boards and post this article as a new
: message by highlighting the text of this letter and selecting paste
: from the edit menu. Fill in the Subject, this will be the header that
: everyone sees as they scroll through the list of postings in a
: particular group, click the post message button. You're done with
: your first one! Congratulations...THAT'S IT! All you have to do is
: jump to different newsgroups and post away, after you get the hang of
: it, it will take about 30 seconds for each newsgroup! **REMEMBER, THE
: MORE NEWSGROUPS YOU POST IN, THE MORE MONEY YOU WILL MAKE! BUT YOU
: HAVE TO POST A MINIMUM OF 200** That's it! You will begin receiving
: money from around the world within days! You may eventually want to
: rent a P.O.Box due to the large amount of mail you will receive. If
: you wish to stay anonymous, you can invent a name to use, as long as
: the postman will deliver it. **JUST MAKE SURE ALL THE ADDRESSES ARE
: CORRECT.**

r. Now,
: each of the 5 persons who just sent me $1.00 make the MINIMUM 200
: postings, each with my name at #5 and only 5 persons respond to each
: of the original 5, that is another $25.00 for me, now those 25 each
: make 200 MINIMUM posts with my name at #4 and only 5 replies each, I
: will bring in an additional $125.00! Now, those 125 persons turn
: around and post the MINIMUM 200 with my name at #3 and only receive 5
: replies each, I will make an additional $625.00! OK, now here is the
: fun part, each of those 625 persons post a MINIMUM 200 letters with
: my name at #2 and they each only receive 5 replies, that just made me
: $3,125.00!!! Those 3,125 persons will all deliver this message to 200
: newsgroups with my name at #1 and if still 5 persons per 200
: newsgroups react I will receive $15,625,00! With an original
: investment of only $6.00! AMAZING! When your name is no longer on the
: list, you just take the latest posting in the newsgroups, and send
: out another $6.00 to names on the list, putting your name at number 6
: again. And start posting again. The thing to remember is: do you
: realize that thousands of people all over the world are joining the
: internet and reading these articles everyday?, JUST LIKE YOU are
: now!! So, can you afford $6.00 and see if it really works?? I think
: so... People have said, "what if the plan is played out and no
: one sends you the money? So what! What are the chances of that
: happening when there are tons of new honest users and new honest
: people who are joining the internet and newsgroups everyday and are
: willing to give it a try? Estimates are at 20,000 to 50,000 new
: users, every day, with thousands of those joining the actual
: internet. Remember, play FAIRLY and HONESTLY and this will really:
work.

4540. Manipulating files

Newsgroup: comp.sys.atari.programmer

Hi,

I'd liked to thank everyone who helped me on the clink problem, that's sorted and now I'm getting the feel of Lattice. Also my problem with the argument reader is over, I'm now using arc from unix libary.

Anyway, now my next problem. I have a file opened with fdopen and in that file are ascii characters. I have a file that has contents like:
Name=1234
Password=5678
And I need to take the variables and write them into another file. So the text from the source file is changed and written into another file like this:
N=1234
Pword=5678

I'm finding this section quite difficult, the only possible solution I can see is using unix function "stcpm" or "stcpma"

Is there any other functions I could be using?

4541. vqt_devinfo

Newsgroup: comp.sys.atari.programmer
Date: 2000-12-09 05:03:40 UTC
From: G Swaine <g.swaine@the.gluepot.com>
Message-ID: <90sefq$1dp8$1@news.comnet.co.nz>
Source record: 1460

I seem to be having a problem with calling the GDOS function vqt_devinfo, while looking for the available GDOS printers.

According to my docs, you pass it a VDI handle, device number, pointer to an "exists" flag, and a pointer to a string. It will then return a YES/NO in the exists flag, and the driver name in the string.

However, this does not seem to work properly when I iterate through the GDOS printer device numbers. Even if a device number has been assigned to a driver, and they're correct in the ASSIGN.SYS file, I still get a zero in the exists flag, meaning the device doesn't exist.

The only way I can seem to make it work is to open the device workstation first. This can be a pain - especially if one of the printer device numbers happens to be an ACSI device and isn't connect, or is switched off. This will hang my TT for about 14 seconds inside the v_opnwk() call.

I've checked that I have a sufficient GDOS (I need Font, FSM or SpeedoGDOS for the function) - I am using SpeedoGDOS 4.1.

Anyway, here is what my code looks like:

```
if( gdos_version < 0x200 ) { // Original bitmap GDOS?
for( a = 21; a <= 30; a++ ) { // iterate through printer device
nums
work_in[0] = a; // set device num to loop
var
v_opnwk( work_in, &handle, work_out ); // try to open device
if( handle ) { // non-zero handle = OK
printer_list[counter++] = a; // add device num to
successful list
v_clswk( handle ); // close device
}
}

}
else { // otherwise Font, SM, Speedo GDOS
for( a = 21; a <= 30; a++ ) { // iterate through printer
device nums
// if I add a v_opnwk() line here, vqt_devinfo works, otherwise
it doesn't

vqt_devinfo( vdihandle, a, &exist, driver ); // get device
info
if( exist ) // does it exist?
printer_list[counter++] = a; // add to list
```

```
}
}
```

try making the driver resident in the assign.sys file, using a line
something like this ...

21r printer.sys

could I also (modestly) point out that my ttf-gdos supports
vqt_devinfo(). It's at ftp://chapelie.rma.ac.be/atari/

you may also find that fontgdos is slightly buggy in this area, and
doesn't set the return values (at all). I suggest that before you
call vqt_devinfo() you set
intout[0] = 0; /* only set if driver is found */
contrl[2] = 1; /* nr words in ptsout[] */
contrl[4] = 11; /* len filename */

good luck, I hope this helps

Use "standard" functions where you can. In this case 'strchr' and 'malloc' will do the job (along with strlen,strcat,free). I've used C++ (//) comments here 'cos I'm being lazy - the code I've written is C though. :-)

```
#include <appropriate headers> //I dont use Lattice
//string.h stdlib.h mem.h

// think about this function at a later date
// well worth understanding though
// (ie how come 'void' can be dereferenced?)
// clue: it can't
static void
memkill(void **p)
{
if (!*p) return;

free(*p);
*p = NULL;
}
```

```
// 'static' means "keep this function hidden
// in this source file". If you had another
// "static ChangeToken()" in another file they
// wouldn't see each other and everything would
// work fine (two independant functions).
static char*
ChangeToken(const char s[], const char n[])
{const char * p;
char * ss;

if (NULL == (p = strchr(s,'='))) return NULL;

p = &p[1];
ss = malloc(strlen(n) + 1 + strlen(p) + 1);
if (!s) return NULL;

strcpy(ss,n);
strcat(ss,"=");
strcat(ss,p);

return ss;
}
// why (NULL== ...) ?
// Consider...
// if (s == NULL) ...
// and if you mistyped it...
// if (s = NULL)
// <G>

// hack together some 'strings'...
int
main()
{char * old_lines[] ={
"Name=1234",
"Password=5678"
}
;
char * new_lines[2] ={NULL,NULL}; /*(1)*/

new_lines[0] = ChangeToken(old_lines[0],"N");
new_lines[1] = ChangeToken(old_lines[1],"Pword");

if (new_lines[0] && new_lines[1])
printf("[%s][%s]\n",new_lines[0],new_lines[1])
;

memkill(&new_lines[0]);
memkill(&new_lines[1]);

return 0;
}
```

(1) Figured out 'memkill' yet?

I'll elaborate on anything you can't figure out.

Have Fun!

As you'll appreciate, a box-standard 520ST is going to be limited on
what it'll run - unless it has a hard disk, which opens things up
somewhat.

Let us know. Also - is it ST,ST(e) etc?

Hi,

Is there something like Atari Compendium only for Milan?
Basicly I'm looking for list with description of all functions (in C)
available for Milan 040/060.

Hi Rafal

No compendium that I know of, but try asking Frank Naumann or Michael Schwingen, they know a lot about Milan and programming.

Thanks a lot :)
But Milan GmbH should make something like this, that would be very usefull
for programmers.

4550. Turbo C v2.0 eats data

Newsgroup: comp.sys.atari.programmer
Date: 2000-12-14 14:05:13 UTC
From: damir kaknjo <dk33806@pinus.cc.fer.hr>
Message-ID: <91ak2p$6bi$1@bagan.srce.hr>
Source record: 1469

Yesterday I was working on my Atari 1040 STf with Borland Turbo C
v2.0, on a program that reads a picture file from disc and shows it
on the screen, but I have noticed that sometimes it jumps over a byte
in the file, and don't read it. So the picture on the screen is smaller
and looks corrupted. I don't know how to fix this problem. I am running
the program with 250kB ramdisk, but I still have around 300kb free memory.
Reading the picture with gfa basic, stad, arabesque or any other program
is correct.

How do you read the picture? Do you use GEMDOS or standard C functions?
If you use the C functions, did you open the file in binary mode?

Hi,

I have a problem. I'm trying to make some graphics and I have some
problems with NOVA card and Afterburner on Falcon (ofcourse) :(
How should I use vro_cpyfm for NOVA card? How can I recognize that NOVA
is installed?
What about Afterburner? Is it in 100% compatible to F030 ? (for example
VsetRGB).
Or where can I find answers on my questions?

Marry Christmas for all

vro_cpyfm works just the same on the Videl and Nova. It's no necessary to
do anything Nova-specific unless you want to bypass the VDI and modify the
bitmaps directly.

> What about Afterburner? Is it in 100% compatible to F030 ? (for example
> VsetRGB).

The Afterburner doesn't do any changes to the VDI, so it's 100% compatible
with a 030-Falcon.

>Does anyone know where I can find Emulator Source Code for the Atari ST/TT?

Get the source of STonX or take the source of WinSton (now Stew):

The StonX Homepage.
http://www.complang.tuwien.ac.at/nino/stonx.html

BUT, the sources from SUSE (as .rpm) are a bit changed and partitially
better! There is also a DOS Version of STonX (also with sources).

I don't know, where I got the Winston sources from, but I can send it
to you, if you (as me) can't find them (in the new year, when I'm back
mail me directly).

If you are interested, how 68000 emulators are done, have a look at
the great papers from

http://www.squish.net/generator/

This is about a SEGA Genesis emulator, which emulates a 68000 CPU and
the atari soundchip.

Martin

And I would highly recommend against this. If you want your
software to run on video cards, don't mess around with the memory
directly. What you will discover is that a small speed gain on one card
will break it for several other cards (some from the same manufacturer).

>I didn't ;(
>Please, I would be grateful if you could send it to me.

First off, you need to identify the existance of MagiC via the cookie
jar. The jar "starts" here...

```
#define SYS_P_COOKIES ((LONG*)0x5a0)
```

...and you need to be in supervisor mode to access it. The cookie for
which you are searching is...

```
#define MAGX_COOKIE_ID 0x4d616758L
```

...and cookies are stored in an array of structures declared in a
manner similar to this...

```
typedef struct {
ulong c_id, /* cookie id */
c_up; /* cookie user pointer */
} COOKIE;
```

If there is no cookie jar then (*SYS_P_COOKIES) will be NULL. Where at
least one entry exists then the end of the array is denoted by member
'c_id' being set NULL.

Assuming you are already in supervisor state then...

```
int
find_cookie(COOKIE *cp)
{COOKIE *c =(COOKIE*)(*SYS_P_COOKIES);
int i =-1;

while (c && c[++i].c_id) {
if (c[i].c_id == cp->c_id) return i;
}
```

```
return -1;
}
```

...will return the array index of the desired cookie, or -1 if it doesn't exist. 'cp' is a pointer to the (COOKIE) for which you want to search. EG:

```
COOKIE c ={MAGX_COOKIE_ID,irrelevant};
int x;

//enter superstate
x = find_cookie(&c);
if (x >= 0) {
c = ((COOKIE*)(*SYS_P_COOKIES))[x];
}
//back to userstate
```

At this point 'x' will be zero or greater if the cookie exists (ie some version of MagiC does exist) and less than zero if MagiC isn't there at all. Where MagiC does exist 'c' will contain the contents of its cookie. From this point on we are interested in 'c_up' - the "user pointer". The meaning of 'c_up' is dependant of whatever it is you are looking for. In the case of MagiC, it points to one of these structures...

```
typedef struct {
long config_status;
DOSVARS * dosvars;
AESVARS * aesvars;
} MAGX_COOKIE;
```

...and it is 'aesvars' which contains the desired information: the 'release' and 'version' members of the (AESVARS) structure is what you're after.

Loosely...

```
MAGX_COOKIE *mc =NULL;
COOKIE c ={MAGX_COOKIE_ID,irrelevant};
int x;
uint32 r;

//enter superstate
x = find_cookie(&c);
if (x >= 0) {
c = ((COOKIE*)(*SYS_P_COOKIES))[x];
mc =(MAGX_COOKIE*)&c;
}
//back to userstate

if (!mc) return no_magx_status;

r = mc->aesvars->release;
r <<= 16;
r |= mc->aesvars->version;
```

```
return r; //hi-word=release, lo-word=version
```

The only <magx.h> header file I can find is for version two. I can email it if you want but please note I had to add stuff to it from the manual as the file hadn't been ammended to reflect changes mentioned in the manual.

I don't think it would increase the size above 16x16, but in case you
are interested there used to be a Mouse Ka Mania PD program available
that could substitute various cursors for the Atari one, or allow you to
make your own.

Happy New Year to you too! (Lay off too much of the Slivovic!)

4569. GCC under TOSFS (8+3)

Newsgroup: comp.sys.atari.programmer
Date: 2001-01-02 18:16:41 UTC
From: Gilda Henrik <di98gihe@chl.chalmers.se>
Message-ID: <Pine.GSO.4.10.10101021859290.25881-100000@monster.chl.chalmers.se>
Source record: 1488

Hi!

I've tried installing GCC 2.8.1 from Christian Felsch's homepage. I followed the instructions for installing under TOSFS very closely, and it works. Almost.
I can make gcc compile a normal c-file, but when I try compiling a c++-file, I get some strange errors, like these:

E:/PROGRAMM.ING/GCC/INCLUDE/G++/streambuf.h:394: warning: invalid type 'void *' for default argument to 'ios *'

and

linking: c.a
./cc6200001.o: Undefined symbol _cout referenced from text
./cc6200001.o: Undefined symbol ostream::operator<<(const char *) referenced from text

I think it's strange that I get error messages on the include files that comes with the package. I suspect that I've missed some settings of GCC, but I can't find anything else in the installation instructions. I've made sure that GNUEXEC, GNUINC, GNULIB, and GXXINC are in the environment. And besides, I don't think it's because of that, because GCC does find the include files.

Any suggestions?
Regards
Henrik

Have you forgotten to invoke gcc with g++ here? Remember to use g++
instead of gcc if you want to link C++ programs.

Ciao

Thomas

Ooops! That's what I had forgotten... It works now with g++.
Strange that it doesn't say anything about that in the documentation
though. But I guess that a certain IQ is assumed... ;-)

I still get that first "invalid type" error message though, but it did
work when I tried to compile a small "hello world" program. Unfortunately
the final executable was rather large: 102KB...

Regards
Henrik

At least the IQ to read the man page supplied with gcc ;)

-- snip --
DESCRIPTION
The C and C++ compilers are integrated. Both process input
files through one or more of four stages: preprocessing,
compilation, assembly, and linking. Source filename
suffixes identify the source language, but which name you
use for the compiler governs default assumptions:

gcc assumes preprocessed (.i) files are C and assumes C
style linking.

g++ assumes preprocessed (.i) files are C++ and assumes C++
style linking.
-- snap --

Or does Christian's packed not include this?

> I still get that first "invalid type" error message though, but it did
> work when I tried to compile a small "hello world" program.

It wasn't an error, but a warning. Shouldn't normally happen with system
includes, but if everything works, I wouldn't worry.

> Unfortunately the final executable was rather large: 102KB...

Did you strip it?

4573. GCC under MagicPC

Newsgroup: comp.sys.atari.programmer
Date: 2001-01-03 18:13:10 UTC
From: Gilda Henrik <di98gihe@chl.chalmers.se>
Message-ID: <Pine.GSO.4.10.10101031820330.26261-100000@monster.chl.chalmers.se>
Source record: 1492

Hi again!

Now that gcc works reasonably well under TOSFS on my falcon, I'd like to make it work under MagicPC too. I installed it in exactly the same way as described in Christian's documentation, but when I try to run either gcc or g++, it doesn't get very far. All I see are the four or five first lines of gcc's output when using the -v option. I compared it to when running on my falcon, and gcc (or g++) stops just before it says something about "m68K MIT syntax". I don't know what the program is doing then, but it's the same everytime.

I can't figure out what the difference there could be between my falcon and the pc, because all gcc is supposed to do is read a file and write an output file...

Anyone out there who has succeeded in running gcc 2.8.1c under MagicPC 6.1 and Jinnee 2.01?

Could it be something about the filesystem used? (it's FAT32 under MagicPC too, I suppose, since windoze98 uses that).

Regards
Henrik

Do you use gcc on a container drive or an existing windows folder? Try
using a container drive, as the XFS MagiC PC uses to access windows
folders has some bugs / problems, which may well be the cause of your
difficulties.

I assume that container drive means that a drive under MagicPC is mapped to a folder under windoze98, right? The C:\ under MagicPC is actually c:\program\magic_pc\magic_c\ under windoze, and I've only tried using the container drive c:\. I have also mapped (windoze) C:\ as D:\ under MagicPC, to get access to the rest of the harddrive, but haven't tried compiling from that drive yet. I'll give it a shot then. Hopefully it'll work.

No, exactly the other way around: What you mean is what I've called a
folder drive.

A container drive is actually a large file inside the PC's directories
which MagiC PC accesses as it were a Atari harddisk partition. And I
assume your problems would disappear if you'd use gcc on such a drive,
instead of a mapped windows folder.

> instead of a mapped windows folder.

Well, I just tried running gcc from a 32MB container drive (making sure the GNUEXEC and the other environment variables point to the correct locations), but unfortunately it didn't make any difference. It stops at the same place. Sometimes it says ***SYSTEM ï¿½BERSCHRIEBEN*** also, which I assume is caused by the bug(s) in the file routines of MagicPC. So there's not much do to about it then, until the bugs are fixed. :-(

I would like to thank you Thomas for your time and patience.

Henrik

4578. mapping a new drive under GEMDOS

Newsgroup: comp.sys.atari.programmer
Date: 2001-01-11 00:13:02 UTC
From: Gilda Henrik <di98gihe@chl.chalmers.se>
Message-ID: <Pine.GSO.4.10.10101110044300.2964-100000@monster.chl.chalmers.se>
Source record: 1497

Hi!

I'm trying to make a program that will provide my own type of network filesystem
functions (I don't mean NFS for mint) under TOS. I figured that I would have some sort of file server, which I will have to code too, on a pc or another atari, and map a new drive to GEMDOS. What I'm wondering is: Is there an easy way to map this drive to gemdos, and make gemdos call my own routines when Fopen and other functions are called, or will I have to hack GEMDOS in some way?

I've already prepared myself for the event that I would have to hack gemdos instead. I've managed to replace the Trap vector ($84) with my own. Until now all my routine does is jumping through the old vector, but I have verified that it works, by for example switching the background color of the screen before jumping through the vector. This gives an annoying flickering screen when opening files and so on. :-)

I've also tried detecting what kind of GEMDOS call was made before jumping through the old vector, but this has failed totally. If I'm not mistaken (and according to the 68030 manual from motorola) the stack frame generated by a trap call is 8 bytes in total (sr (Word), pc (Long), vector number (Word)). And the last thing that is put on the stack before the trap
call should be the GEMDOS function number, so that when my own GEMDOS vector is entered all I have to do is retreive a word from 8(sp), to get the function number. For example if I want to make the screen flicker when someone calls Cconws the following should do just that:

```
myGEMDOS:
cmp.w #CCONWS_FUNCTION,8(sp) did they call Cconws?
bne.s jump_through_old nope, do nothing special

bsr flicker_screen yes, flicker screen
jump_through_old:
move.l oldGEMDOS,a0
jmp (a0) let the old GEMDOS do its
stuff
```

I've tried varying the offset (8 in the above example), but my routine never detects a Cconws call. Is there something about the trap handling that I don't know?

Note that this last part about hacking GEMDOS is really not necessary to solve if there is a simple solution to my first problem (look in the beginning of this post).

Regards
Henrik

Actually, it is usually retrieved from 0(USP). For total compliance,
you should check the status word at 6(sp) to see if you were in user
or supervisor mode when the trap occured, then do either a LEA 8(sp),A0
or MOVEA.L USP,A0 to get the arguments.

I think MetaDos provides just this. However, I do not know where to find
documentation on how to write a MetaDos driver - Julian Reschke should know
this.

>I've also tried detecting what kind of GEMDOS call was made before jumping

Watch out: the offset is 6 for 68000 and 8 for 68010 and newer. You can used
the system-variable _longframe ($59E IIRC) to detect this - if it is
non-zero, the offset is 8.

> cmp.w #CCONWS_FUNCTION,8(sp) did they call Cconws?
> bne.s jump_through_old nope, do nothing special

You have to check if the parameters are on the user or the super stack
(check the bit in the saved PSW in the stack frame).

IIRC, on the user stack, the offset is constant, while on the super stack,
it is 6 or 8 depending on CPU.

You might consider using TraPatch - that's a little freeware TSR that
handles hooking into system vectors for multiple programs, which means it is
(a) more efficient if multiple programs hook into the same vector, and (b)
you don't have to worry about these details.

If you hook into GemDos, you have one more problem to solve: you need
filehandles that you know Gemdos will never return - and that don't collide
with MetaDos and similar programs, either.

GH>I've also tried detecting what kind of GEMDOS call was made before
GH>jumping through the old vector, but this has failed totally.
Have a look at my TraPatch.
It allows you to hook into any BIOS, XBIOS, GEMDOS, AES and VDI function.
And as your code receives a pointer to the parameters in a register, you
don't have to find them yourself dealing with stack frame sizes and the
callers mode (and stack).
An additional benefit is that your code doesn't slow down the calls you're
not interested in

Bye

Joerg

The code you have provided will only work if the software is running on a 68010 or newer CPU, and the code calling GEMDOS was in the 68k's Supervisor mode before the call.

A better approach would be something like this:

(I've taken advantage of the fact that GEMDOS is documented to destroy the three lowest data and address registers. This code is also XBRA compliant, calling the previous handler if it isn't Cconws being called)

```
dc.l 'XBRA' ; XBRA compliant
dc.l 'CCWS' ; XBRA flag identifying this handler
oldhandler ds.l 1 ; old handler address
trap
lea 6(sp),a0 ; opcode offset for supervisor call
move.l usp,a1 ; get user stack
tst.w $5a0.w ; big frame? (68010+ have 8 byte frame)
seq d0 ; set small frame flag
beq.s smallerframe ; no - it's a 68000 or 68008
addq.l #8-6,a0 ; increment stack pointer
smallerframe
btst #13&7,(sp) ; were we called from user mode?
sne d1 ; set "called from super" flag
bne.s calledfromsuper ; no, so skip it
move.l a1,a0 ; a0 = USP
calledfromsuper
cmp.w #CCONWS,(a0) ; was the called func Cconws() ?
beq.s myhandler ; no, so go to my handler
move.l oldhandler(pc),-(sp) ; push address of old handler
rts ; jump to it

myhandler:
move.l trapstack,a1 ; get old frame stack
move.w (sp)+,-(a1) ; pop stacked SR, push onto my stack
move.l (sp)+,-(a1) ; pop stacked PC, push onto my stack
tst.b d0 ; small frame flag set?
beq.s shortframe ; yes, so no "format word" to transfer
move.w (sp)+,-(a1) ; pop stacked format-word, push onto my
stack
shortframe
```

```
move.l sp,-(a1) ; save old stack pointer
move.l a1,trapstack ; save new stack pointer

tst.b d1 ; called from supervisor?
bne.s supercall ; yes - no need to swap stacks
move.l usp,sp ; set sp to point to user stack
supercall

jsr myCconwshandler ; call handler with params on stack

move.l trapstack,a0 ; fetch my stack pointer
move.l (a0)+,sp ; pop old stack
tst.w $5a0.w ; long frame or short?
beq.s returnfromshortframe
move.w (a0)+,-(sp) ; pop saved formatword, push onto stack
returnfromshortframe
move.l (a0)+,-(sp) ; pop saved PC, push onto stack
move.w (a0)+,-(sp) ; pop saved SR, push onto stack
move.l a0,trapstack ; save trap stack pointer
rte ; return to prog/func that called
me

; sp+0 stack pointer
; sp+4 Cconws func num
; sp+6 string pointer
myCconwshandler
move.l 4+2(sp),a0 ; fetch string to be printed

nop ; do whatever you wanna do

rts ; normal subroutine return, to trap handler

SECTION DATA
trapstack
dc.l stacktop ; saved pointer to stack of old GEMDOS trap
frames

SECTION BSS
ds.b 12*16 ; 16 level stack of 12-byte (stackframe+SP)
stacktop

END
```

(Better, more-efficient code could probably be written, but this should
give you an idea of what should work. I haven't actually tried this
code, having written it while online)

Hi there,

I have a problem using standard VDI functions to paste images from
memory.
I'm working with 8 bitplanes....
So, the highest color is 255 (0-255) and if I use such color, system
changes it to 1..
Why?? Can someone help me?

Unluckily I don't have access to my sources at the moment so I can't
tell you the exact mapping but I had a similar problem when loading
and displaying images and after some trial and error I coded a
function to map the colours. IIRC with 8 bitplanes VDI mixes up
colours 0 to 15 and 255, at 4 bitplanes it mixes up only colours
0 to 3 and 15 but why it does that at all is beyond me.
I could tell you the mapping after the weekend but until then I think
you will have found it out yourself since you can see it at once if
you draw a picture with e.g. PixArt, and then load and display it
with a tiny self written program.

Gerhard

No, tell me. Probably I'll have no time for solving this problem...
BTW. The color 254 is 254. There are problems only with 255 :(

As I said colors 16 to 254 all are correct. That's what I'm sure.
What I'm not sure to remember correct is :

0 - 0
1 - 255
2 - 1
3 - 2
4 - 3
.
.
15 - 14
255 - 15

You can try it that way and if it's not correct I can tell you after
the weekend.

Gerhard

Hmmm, pretty smart ;)
But is the system doing such things ???
I'll try this, but anyway show me your solution after the weekend...

You have to hook XBIOS vectors, this is what I did in MIKENET software, maybe
I still have that big all ASM sources around, left at the point where I
started to use the parallel port instead of the MIDI ports.

It would be really nice to have a look at your code. Coulde you mail it to
me? :-)

I would like to thank all you others too who replied to my questions. All
your solutions seem equally good too me, but I think I'll try TraPatch
combined with the MIKENET sources, and see what I can come up with. I've
save your replies for future reference.

You can't add a non-FAT FS by hooking into XBIOS - Gemdos will handle the
drive internally and access it on a sector-by-sector basis, and assume there
is a FAT FS on it.

He wanted to have a network drive (where there probably is *no* FAT FS on
the other end, eg. when running on some UNIX machine), so he has to
intercept Gemdos directly and pass the file access functions across the net.

Yepp, what I'm trying to do is make files in an ordinary
window$-environment accessible on an atari through the network. I think
the best solution would be to forward the necessary gemdos calls (like
Fopen and Fread for instance), and not try to read sectors from a
partition under window$, since it would certainly not like that.

>
> Oops, it's not like that.
> 255 -> 1 !!!

The VDI always uses 0 for white and 1 for black.
The XBIOS uses 0 for white and the highest possible value for black.
3, 15, 255 respectively.

On the TT in duochrome 254 and 255 are used.

More general: vs_color(h,0) is background colour, (h,1) is foreground colour,
to make these notions the same on all colour depths.

Lightspeed C was pretty good. It was an integrated development environment,
its own DOS and editor for writing programs vs "use your favorite WP" type
of stand alone compiliers.

Can't remember which one I fooled with, could have been CC65, but it
understood braces
for {
vs
for $(

Like you have to do with most Atari C compilers.

The best assembler is MAC/65 I think but I have seen several other good assemblers for the 800XL...
For the best C compiler you can use CC65 for 800XL it's not supported anymore, but still very good. The only problem is you need a big ramdisk or harddisk to use the compiler/linker with all libs...
But CC65 is also available as cross-compiler for PC. You can find it at WWW.CC65.ORG it's still supported and you can download the latest version there...A lot of Atari 8-bit support is added lately...

Oh yes right, this is why MikeNet was so fast and relayable, and I had big
problems while starting to think to a multipoint real network, to other
platforms too.

I've never stopped supporting it. Check out-

http://members.nbci.com/cc65foratari/

It has the cross compiler version available for downloading, plus some
libraries and source code. It is completly compatable with the J.R.
Dunning version and libraries, and includes his cool multi-pass executables
that make the forward referencing of symbols a snap without the use of alot
of header files or declarations.

Hi there,

Is there any possibility to know that in your Falcon NOVA Card is
installed?
If yes, then how?

And another question concerning the NOVA card.
If I use standard MFDB structure what should I change to display it
correctly on NOVA card.
SwapByte in mfdb->fd_addr ?

If you can display over 256 colors then you have the Nova card. I believe a
regular Falcon could not display over that amount.

I wouldn't go this route, unless there was some really big
incentive to do it. The reason being if you avoid checking for specific
hardware and look more at the reported capabilities of the system from the
vdi workstation, you do not lock the program into one particular
configuration. Ie Does your prgram do something special on a Nova Card
that could just as easily be done on an Eclipse?

Also it's questionable to try and shrink your potential userbase
if you are hoping for any sort of return from the product.

If you are using the VDI, no change should have to be made. The
driver handles any conversions that might need to be done.

Dan Ackerman
aka baldrick@netset.com

No, I'm just showin some pictures on the screen ;))
But one of my tester reported me that there are some problems when he uses
NOVA Card (I have a screen shot).

> Also it's questionable to try and shrink your potential userbase
> if you are hoping for any sort of return from the product.

No, I'm only trying to make my programm compatible also with NOVA not only
with standard Falcon.

So why the picture is deformed?
I'm using standard VDI calls (vro_cpyfm)...

> ps. When are we going to see snapshots of Tales of Tamar for the Atari?

:))
Tales of Tamar will be only a port of Amiga game, so it will be exactly the
same as on Amiga (it'll look exactly the same).
You can see snapshots on www.tamar.net :-))

Well what programming language are you using That would probably
be the next question. It is probably something very small as I saw this
hapen with my code before. Work for most people and then one person was
getting garbage. It was one of a few things for me. The manner in which
I was setting the base address for the screens MFDB, the manner in which I
was clearing a buffer, or the definition I was giving the buffer. Sorry I
can' be more exact than that, but without knowing if you are using C, ASM
or GFA it makes it a bit hard to be exact on some of that. Those were
also the changs that I put in place that cleared up the problem for that
particular user. So I'm not certain exactly which one it was.

>

I mentioned a few things above that might be your problem.

In C they would be the following.

```
screen_mfdb.fd_addr = 0L; /* I've had other settings work for some but
not all setups */

vro_cpyfm(vdi_handle,(screen_planes >
9)?ALL_BLACK:ALL_WHITE,array,&pic_buf,&pic_buf);
/* not memset. Memset works with atari hardware, but can be problematic
with a graphics card */

picture_buffer = (short *)malloc(....)
/* I had this one recommended to me ;) */
```

Arcade,

Your must include the following line in the source code

<seven spaces>processor 6502

then compile

To make a good binary, your command line should look like this:

dasm source.s -f3 -osource.bin

Good luck,
Bill

4613. Reentrant gemdos functions?

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-01 15:50:36 UTC
From: Gilda Henrik <di98gihe@chl.chalmers.se>
Message-ID: <Pine.GSO.4.10.10102011626090.1284-100000@monster.chl.chalmers.se>
Source record: 1382

Hi!

I wrote some questions about a network filesystem I wanted to code, a few weeks ago (the subject was "adding new drives to gemdos" I think). I got numerous responses on my questions, enough to get me started. The whole idea was to hook into gemdos functions so that I could forward certain function calls (like Fopen, Fcreate and so on) to the "fileserver". The fileserver would run on a linux system, to make things easy. One advice I got was to make my gemdos functions reentrant. I don't think I understood clearly what that meant, but I suspect it means that many processes should be able to call my routines at the same time without risk of collisions. And I've come up with one problem that I don't know how to solve: I want the whole network filesystem to be runnable under normal TOS, which implies that I need to cover the Fsfirst and Fsnext functions (and also Fsetdta). With only one process as with normal TOS, there's no problem, as long as the process has called Fsetdta, so that my routines know which DTA to fill in when Fsfirst and/or Fsnext is called. BUT with multiple processes I need to know somehow which process called Fsetdta, and also Fsfirst/Fsnext, so that I don't fill in the wrong DTA. Any ideas? The original Gemdos must have a way to do this, but I don't know anything about it.

Regards
Henrik

Hello Henrik,

Wouldn't the Dopendir/Dreaddir/Dclose dir functions help ? I guess they already know how to deal with your problem (in a multitasking environment) so it's no use trying to redo the same thing, maybe you can just try to map your Fsfirst/Fsnext with these calls ?

> processes I need to know somehow which process called Fsetdta, and also
> Fsfirst/Fsnext, so that I don't fill in the wrong DTA. Any ideas?

What about adding a _DTA* parameter to your Fsfirst to tell it what structure it should fill ?
Also, if you need to identify a process, Pgetpid() is for you !

> The
> original Gemdos must have a way to do this, but I don't know anything
> about it.

Why don't you have a look at the FreeMiNT sources ? Even if it's not the original GEMDOS it's compatible so it will give you an idea of how things can be done ?

Vincent

According to the book'le livre du dï¿½veloppeur de l'Atari ST',
and to the STonX Gemdo emulation sources, it seems that
- the _dta is available from the active program's basepage
(offset 0x20 from the basepage)
- the basepage of the current active basepage is in
*((char**)(_sysbase+0x40)), where _sysbase = *((char**)0x4F2)
Hope it helps.

GH>think I understood clearly what that meant, but I suspect it means
GH>that many processes should be able to call my routines at the same
GH>time without risk of collisions.
Yes, that's it. Most important is not to use any global variables

GH>With only one process as with normal TOS, there's no problem, as long
GH>as the process has called Fsetdta, so that my routines know which DTA
GH>to fill in when Fsfirst and/or Fsnext is called. BUT with multiple

GH>also Fsfirst/Fsnext, so that I don't fill in the wrong DTA. Any ideas?
Use Fgetdta().
It works even if the process hasn't called Fsetdta() (it then returns the
default DTA) and you can also call it from inside an AES/VDI/GEMDOS trap

Bye

Joerg

What kind of problem is there with the display?

If you're trying to create device specific MFDBs yourself, things can
go wrong unless you use the right way to figure out the screen layout.
I've had lots of problems trying to get all programs working correctly
on the Eclipse/RageII.

>I was setting the base address for the screens MFDB, the manner in which I

It should always be zero.

>>So why the picture is deformed?

Deformed how?

>>I'm using standard VDI calls (vro_cpyfm)...

See above regarding device specific MFDBs.

>screen_mfdb.fd_addr = 0L; /* I've had other settings work for some but
>not all setups */

This will work with any non-buggy VDI.
Putting an actual screen address in there may not even be possible, since
there might not be one (and asking the XBIOS for it isn't a terribly good
idea). At the very least, it makes the job harder for the VDI in the case
of graphics cards.

>vro_cpyfm(vdi_handle,(screen_planes >
>9)?ALL_BLACK:ALL_WHITE,array,&pic_buf,&pic_buf);
>/* not memset. Memset works with atari hardware, but can be problematic
>with a graphics card */

Please, don't do that when trying to fill an area of the screen with
black/white! Sure, it will probably work fine for your program (but not

necessarily since there _are_ actually 8 bit true colour modes around),
but some old programs always use the ALL_WHITE (a terrible name) mode.
The only way to get those old programs to work right is to make the VDI
change the blit calls from D=0 to D=1 and vice versa, which fVDI can do
if asked. Now, if some program does the 'correct' thing, that one will
fail instead, since there is no way the VDI can know which is which.

There are perfectly fine area filling functions (v_bar/vr_recfl) which
will always do the job (well, at least if you make sure you use the
correct colour index) right.

If you're clearing/setting an off screen buffer there is obviously no
problem with memset().

>picture_buffer = (short *)malloc(....)
>/* I had this one recommended to me ;) */

What's special about that one? The short*?

In C, the void* returned by (modern) malloc will automatically be casted
to whatever pointer type picture_buffer has. By casting explicitly, you
remove the possibility for the compiler to flag if you'd forgotten to
include stdlib.h (in which case malloc will be assumed to return int).

If you want the code to compile as C++ too, you do need the cast (but in
C++ you should of course not be using malloc in the first place ;-).

4618. FSLog v0.2 released

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-03 21:26:03 UTC
From: baldrick@dilbert.netset.com
Message-ID: <3a7c776b$1_2@athena.netset.com>
Source record: 1388

I put a new version of FSLog up on my web site.

http://www.netset.com/~baldrick/stikapps.html

I thought that I would announce it here as it's been tested and
works with GlueSTiK now as well. And GlueSTiK programmers may not follow
my normal STiK2 announcements.

FSLog is a logging utility for STiK API calls. New version allows
some options on what is logged.

Complete source code in C is included in the archive.

4619. Object GEM Pascal

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-03 21:41:52 UTC
From: peter.slegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <3a7c7b20.0@energise.enta.net>
Source record: 1387

I am trying to learn how to use Object GEM but I am not
doing very well.

Using some example code I have managed to open the application
and set-up the menu as well as drawing a dialog box.

I want to be able to enter some data into two input fields.
Next, pressing a button will allow some processing to be done
and the results returned to two output fields.

Pretty simple I would have thought but it isn't working
that way.

I have pasted a chunk of the code below, you can probably
guess what it's going to do ;-)

Could someone point out what I am doing wrong ?

TIA

Peter

I'm confused by what you are saying here. In the first line ou
say use this method. But in your second quote you talk like this not
necessarily the best method.

>>vro_cpyfm(vdi_handle,(screen_planes >
>>9)?ALL_BLACK:ALL_WHITE,array,&pic_buf,&pic_buf);

8 bit true color mode? That's an interesting confusion. Since
Atari accepted an 8 bit planar mode with the TT, it would seem to me that
an 8 bit true color mode would be a non standard construction that should
be avoided.

>but some old programs always use the ALL_WHITE (a terrible name) mode.

Actually there is. There are NOVA cards out there that use some
strange bit in there driver. Don't ask me what they do, but memset() on
an offscreen buffer for these cards leads to corrupted displays. This is
why I use the slower but more compatible (since it works through the VDI
of the card) in place vro_cpyfm(). If the cards driver are doing
something strange then this should (and seems to) take that into
consideration.

What is the real chance of someone not noticing the lack of
#include <stdlib.h>? There are quite a few other routines in there that
are more than likely going to appear in a section of code dealing with
image decompression. Now why the Cast? Well if you noticed in this
thread both the original questioner and myself are both using PureC, which
is just about anything you want to say except a modern compiler ;)

Not correct! As manufactured, the Falcon could display 64,000-odd
colours but only in ST-Low resolution (320*200). With the help of
Videlity, it can do TrueColor at higher resolution too, though it's
better if Nemesis is fitted or the machine slows down too much.

>say use this method. But in your second quote you talk like this not
>necessarily the best method.

No, in the second line I'm saying that you shouldn't try to put an
actual screen address there. 0 obviously isn't a screen address. ;-)

Use the zero.

> 8 bit true color mode? That's an interesting confusion. Since

No confusion. I've seen several variations.
Even without actual hardware support, you can of course set up the
palette to give, say 3 bit red, 3 bit green, and 2 bit blue.
(Actually, the new palette NVDI introduced with v5 seems to be based on
this principle (it makes it a lot easier to map 16/24 bit images to 8 bit)).

>an 8 bit true color mode would be a non standard construction that should
>be avoided.

Well, yes.

>>If you're clearing/setting an off screen buffer there is obviously no
>>problem with memset().
>
> Actually there is. There are NOVA cards out there that use some
>strange bit in there driver. Don't ask me what they do, but memset() on
>an offscreen buffer for these cards leads to corrupted displays. This is

Strange.

>why I use the slower but more compatible (since it works through the VDI
>of the card) in place vro_cpyfm(). If the cards driver are doing

But then that VDI is in error, since those vro_cpyfm modes are supposed
to fill with all ones/zeroes. The modes are simply all the possible logic
operations on two binary numbers.

> What is the real chance of someone not noticing the lack of
>#include <stdlib.h>? There are quite a few other routines in there that

It has happened to me. ;-)

>are more than likely going to appear in a section of code dealing with

You can get quite far without remembering to include the correct files.
Sooner or later the implicit int arguments are going to kill you, though.

This actually happened to me just the other week when I was porting fVDI
to TurboC/PureC. It was even with malloc(), but in this case not the
library variant. I'd forgotten to declare the function in the file that
used it, and PureC happily passed the size of the area to allocate as an
int (16 bit), not knowing that the function would try to interpret it as
a long (32 bit)...

>image decompression. Now why the Cast? Well if you noticed in this
>thread both the original questioner and myself are both using PureC, which
>is just about anything you want to say except a modern compiler ;)

Isn't it at least supposed to be ANSI compatible?

4623. RC4 bug

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-04 22:20:55 UTC
From: elfsoft@mindspring.com
Message-ID: <95kkk7$g3h$1@slb0.atl.mindspring.net>
Source record: 1392

RC4 is a patented stream encryption algorythm which has become
the defacto standard for random number generators. During my
analysis, I discovered that it has a serious (but easily remedied)
flaw.

The normal (8 bit version) has 256(256!) possible states, making
a thorough analysis impossible. But that is not the case with the
2 bit version (96 states) or the 3 bit version (322,560 states).

What I discovered is that the 96 states for the 2 bit version are
organized into 4 separate loops of lengths 49, 41 and two with 3
states each. For the 3 bit version I have found loops of 238874,
40265, 6625, 5533, 4696, 3008, 2406, 1179, 118, 66 and at least
48 separate loops of 7 states each (so far).

By extrapolation, the 8 bit version should also be subject to short
cycles, possibly as short as 255 states. Needless to say, almost
all keys will produce one of the longer cycles (especially if one
is much longer than all the others), but some will produce cycles
shorter than the code length.

Since the RC4 algorythm otherwise has good performance in terms of
chi-squared tests and auto-correlation, and the odds of hitting one
of the short cycles is so small, the best fix is simply to store
the initial state and detect when it is hit a second time, then
make a random change (such as running the key through it again).

Sorry, I don't know much about ST yet, so I can't help you with the code,
but I'm interested in using Pascal-ish languages with it. Where can I get
an Object-GEM compiler? Also, does anyone know of some freeware/abandonware
Pascal compilers? My favorite language is Modula-3, but I think it'd be a
bit bloated to run on an ST :)
Thanks,
-dan

Source record: 1394
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hello,

I would be very interested in these 3 books (I understand they are [the only?] 3 volumes of a set). They have been out of print forever, and I have had no luck in searching for them in the used book arena. I would really rather do this as a set, as it would save me on shipping costs.

Compute's Technical Reference Guide - Atari ST, Vol 1: The VDI
" " Vol 2: GEM/AES
" " Vol 3: TOS

Now what I'd like to do is this: I will pay shipping both ways, as well as a reasonable fee for your trouble (say, 5-10 dollars for the set, less individually). These books are long out of print and I want the information contained in them, for a little ST programming site I am doing. I will ship them back to you after a week. Obviously there's quite a bit of trust required for this, and I will give you plenty of personal information accordingly. Again, I'd prefer to do this "rental" as a set, but please mail me anyhow if you only have 1 or 2 of them, because I may in the end resort to renting them individually.

Thanks,
-dan

Hi!

John Kormylo <elfsoft@mindspring.com> wrote:
> RC4 is a patented stream encryption algorythm which has become
> the defacto standard for random number generators.

Well, the algorithm actually isn't patented, but was classified as a
"trade secret" by RSA Inc. You couldn't get the source unless you signed
an NDA. That was until 1994, when someone anonymously posted the source
code to sci.crypt.

> During my analysis, I discovered that it has a serious (but easily
> remedied) flaw.
> [Description snipped]

Just a question, but why do you post this to comp.sys.atari.programmer,
and not to sci.crypt, where it actually belongs to? It's nothing Atari
programming specific, I'd say ;)

Furthermore, short cycles in crippled RC4 are well-known. For example,
look at

http://www.deja.com/=dnc/[ST_rn=ps]/getdoc.xp?AN=668939837

or

http://www.burtleburtle.net/bob/rand/isaac.html

That doesn't mean I don't appreciate/value your efforts, but you
could've done some research whether it is a known problem yourself,
couldn't you? ;)

Ciao

Thomas

Hi Dan,

I have always liked the structured approach that Niklaus Wirth (sp?)
and his team put into languages like Pascal and Modula,2,3.

I used to have Modula-2 for the ST but both the primary and
back-up discs failed !

I think it is available from a number of web sites now.

Object GEM is a series of libraries that can be used with
Pure Pascal from Application Systems. ObjectGEM was written by
Thomas Much and is freeware, though I am sure I will make
a donation if I can ever make it do anything.

4629. calling STinG from a trap call

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-14 10:57:13 UTC
From: Gilda Henrik <di98gihe@chl.chalmers.se>
Message-ID: <Pine.GSO.4.10.10102141121380.17060-100000@monster.chl.chalmers.se>
Source record: 1398

Hi!

I'm trying to implement some of my own gemdos system calls. I use TraPatch to hook into the Gemdos trap. From within the trap calls I try to call STinG to connect to a server. But this doesn't seem to behave as expected. When calling TCP_open, it gives a positive answer even though the server isn't up and running. I suspect this could be because the cpu is in supervisor mode while executing the trap, but I'm pretty sure I've heard that the latest version of STinG (v1.26) should work alright in supervisor mode too.

When the server (which is just a simple program running under Linux), is active it reports that the client (my falcon030) has connected. But the falcon (calling TCP_info in a loop to find out when the TCP-state TESTABLISH is reached) never understands that it has a working connection.

Is there something that I have forgot, or something that needs to be patched to make this work?

Regards
Henrik

4632. Set Falcon resolutions

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-21 17:35:34 UTC
From: elmaraka <maraka@atari.net>
Message-ID: <3a93fb49@post.newsfeeds.com>
Source record: 1401

*** post for free via your newsreader at post.newsfeeds.com ***

i want to code a routine to change the Falcon's resolution to True Color Mode in a VGA monitor. I'm doig in assembler and using the XBIOS call "Vsetmode".
But i don't know why whatever resolution i set whit this call, always the screen moves and behaves like when you try to watch a RGB demo in a VGA monitor.
I think it's a problem of my VGA monitor, because i also have the same problems with programs like "Whip!" that should work on VGA monitors and it doesn't in mine.
Any idea why doesn't work this call?
May be not all VGA monitors work fine with Videl chip?

But i also think that many demos work fine in my hardware when i load them from 640x400 16 colours and they change to True Color Mode by them self.

What kind of method they use to change between resolutions?

Thanks in advanced.

Hi!

Is'nt it crazy? Other people sell their Atari stuff - I bought 6
books, and now will start to program the GEM! Funny, aeh?

Yes - I use no Atari, but STonX which now starts to get active again.

http://sourceforge.net/projects/stonx/

Get STonX 0.6.7.3 which now (still beta) provides an interface for
MiNT to the Linux ext2 Filesystem, which it is running on.

I did own an Atari years ago and am now happy to see all the old stuff
again and better new stuff for it. Things I never thought an Atari
would be able to run them.

Martin

That is quite correct.
evnt_mesag and evnt_multi(... MU_MESAG ...)
return in msgbuf[2] the number of bytes in excess of 16

You can then read these byte by issuing a single appl_read on the ap_id that
was returned by the evnt_... calls in msgbuf[1]

ATARI Profibuch (freely):

evnt_mesag(msgbuf);
...
if (msgbuf[2] > 0)
appl_read(msgbuf[1], msgbuf[2], large_enough_buffer);

So if you want to write private messages to a other app, the first 3 shorts must
still be standard.

> any file I/o operations. currently I only found Pexec which takes a
> filename
> as parameter.

Well Pexec is exactly what you need:
(From: ATARI Profibuch)
LONG Pexec(WORD mode, const char *file, const char *cmdlin, const char
*env);
mode:
0 = load and go
3 = load, don't go
4 = just go (This is the one you need: LONG Pexec(4, 0L, BASEPAGE *basepage,
0L);)
5 = create BASEPAGE
6 = just go, then free (gemdos >= 0.15)
7 = create basepage, respecting prgflags (gemdos >= 0.19)

To be honest with you: I have never used these functions. I usualy relocate
the program my self and then start it.

The next question from you will be: how do I create a basepage?
Well try to get some documentation. As you are german (I think) I can highly
recommend:
Atari Profibuch
by:
Jankowski, Rabich, Reschke; Sybex verlag
It knows (almost) everything there is to know about the OS.

I am not sure whether there is any good documentation on line available...

4641. GEMDOS for ATARI is Open Source

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-24 15:29:10 UTC
From: mdoering@mucl.de
Message-ID: <3a97cd19.1896000@news.cis.dfn.de>
Source record: 1410

Hi!

Sorry, if this is new to me, but all other folks know it - just flame me, but:

On this site I found an probably older Version of GEMDOS for the Atari as Open Source:

http://deltasoft.fife.wa.us/cpm/archive/unofficial/

This is the License:

http://deltasoft.fife.wa.us/cpm/archive/unofficial/lisence.html

.. and this THE important part of it:

GRANT. Caldera grants you a non-exclusive license to use the Software in source
code form free of charge for personal, non-commercial use. The Software in
source code form may also be used for commercial development purposes, provided
a license is obtained from Caldera before any products or derivative works are
shipped for commercial gain that utilize the Software , its components or
derivative works.
For the source code license grant, you may:
* use the Software on any
single computer;
* use the Software on a network, provided that each
person accessing the Software through the network agrees to the
terms and conditions of this license
* use the Software on as many computers as
needed provided that each person accessing the Software agrees to the terms
and conditions of this license;
* redistribute the Software for
non-commerical purposes, provided any copy must contain all of the original
Software's proprietary notices, marks and license terms. (Note: redistibution of
derivative products for commercial gain is permitted, provided a
license is obtained before the derivative products are exchanged
for commercial gain)
* copy the Software for archival purposes, provided any copy must

contain all
of the original Software's proprietary notices, marks and license
terms.
* modify, translate, compile, disassemble, or create derivative works
based on
the Software provided that such modifications are for
non-commercial use and
that such modifications are provided back to Caldera except for
those who
have obtained the right from Caldera in writing to retain such
modifications; any modification, translation, compilation, disassembly
or
derivative work used for commercial gain requires a seperate
license from
Caldera;
You may not:
* permit other individuals to use the Software except under the terms
listed
above;
* copy the Software other than as specified above;
* rent,
lease, grant a security interest in, or otherwise transfer rights to
the
Software; or
* remove any proprietary notices , licenses or labels on the
Software.

Frank, what do you think? Is this the base for an emulator BIOS?

Petr, could this also be a base for some people, who think of
recreating GEMDOS for x86 architecture?

I had a short look at it and found no XBIOS. Is this made by ATARI
themselfes?

Martin

Hi Everybody

I'm new in developing programs for AtariST.
I'l try to build a monolithik multitasking system and one of
my very first steps (now) are to play with the vbl interrupt.

what I have done so far:

1. an assembly procedure to register my c - functionpointer which
should be executed

2. an assembly procedure which should be called from an interrupt
which itself jsr to the previous registered C function and
after them makes a RTE.
I save and restore all registers with movem.l d0-d7/a0-a6, -(sp)

this behavior works well till my first call to i.e. printf. if my
user defined interrupt c function calls printf I will get a bus error
within the RTE statement.

what's wrong. should I switch between supervisor and user mode ?

are there any examples for how to call user defined C-functions from
interrupts ?

many thanks

4643. Interrupt and timer

Newsgroup: comp.sys.atari.programmer
Date: 2001-02-24 18:45:44 UTC
From: Neil Wakeling <neil@tuva.demon.co.uk>
Message-ID: <983040451.7874.0.nnrp-08.9e988c11@news.demon.co.uk>
Source record: 1412

Hi all,

I am trying to set up the Atari ST(e), programming in C, so that I can set one of the system timers, then have the timer interrupt and call a function when the time is up.

Is this possible and can anybody help with information on the timers and necessary functions.

I am fairly competent C programmer in GEM, but I dont know how to access interrupts in general, or the timer. Ihave tech notes which give the timer control registers addresses etc, but no information on what values these expect or how the timers behave, or how to set a function to be called by an interrupt.

Many Thanks,
Neil

What time resolution do you want? What kind off application will it be?

> Is this possible and can anybody help with information on the timers and

Eevrything is possible on a ST!

Well if you are expert in GEM you should look at vex_timv() (VDI 118) no
doubt it will cleanly do all timer work you want. If you on the other side
want total control do something like this (parts of a game I have written).

```
------------------8<-------------------------------------------
/* save old registers, note program is in supervisor mode */
old_iea=*(byte*)0xfffffa07UL;
old_ieb=*(byte*)0xfffffa09UL;
old_ima=*(byte*)0xfffffa13UL;
old_imb=*(byte*)0xfffffa15UL;
old_eoim=*(byte*)0xfffffa17UL;
old_tdc=*(byte*)0xfffffa1dUL;
old_tdd=*(byte*)0xfffffa25UL;

old_vbl=*(void **)0x70;
old_timer_d=*(void**)0110;

move_sr(0x2700); /* disable all interrupts, own function */

/* init registers */
*(void**)0x70=vbl_code;
*(void**)0x110=timer_d_code;

*(byte*)0xfffffa07UL=0;
*(byte*)0xfffffa09UL=0x50; /* keyboard and timer d intterupt needed */
```

```
*(byte*)0xfffffa13UL=0; /* interrupt mask */
*(byte*)0xfffffa15UL=0x50; /* keyboard and timer d intterupt needed */
*(byte*)0xfffffa17UL=game.old_eoim&0xf0;
*(byte*)0xfffffa1dUL=7; /* timer d control */
*(byte*)0xfffffa25UL=246; /* timer d data */
move_sr(0x2300);

/* rest of the program */
...

/* restore registers */
move_sr(0x2700);
{
byte *p=(byte *)0xfffffa00UL;
p[0x0b]=0;
p[0x0d]=0;
p[0x0f]=0;
p[0x11]=0;
p[0x07]=old_iea;
p[0x09]=old_ieb;
p[0x17]=old_eoim;
p[0x13]=old_ima;
p[0x15]=old_imb;
p[0x1d]=old_tdc;
p[0x25]=old_tdd;
}
*(void **)0x70=game.old_vbl;
*(void **)0x110=game.old_timer_d;
move_sr(0x2300);

************************************
assembly

vbl_code:
subq.w #1,game+vbl_count ; decrement vbl counter
rte ; done

; register usage
;
; D0 = work
;
; A0 = game
; A1 = $ffff8800
; A2 = $ffff8802
; A3 = play data

timer_d_code:
movem.l d0/a0-a3,-(sp) ; save registers
move #$2300,sr ; enable interrupts (esp keyboard)
move.l #game,a0 ; game struct
...
movem.l (sp)+,d0/a0-a3 ; restore registers
```

```
rte
---------------------->8---------------------------
```

When you want to know more about the MFP registers lookup the Hardware Register Listing at www.saint.atari.org (atari docs, hardware guide). Normally you only want to program timer D, leving all other bit the same.

I hope this helps a bit,

Cu, Hans

after many retries I think I know the problem. I gemdos is not
reetrant then I shouldn't call gemdos in interrupt functions.
if I do bios calls instead than all goes right

> length message greater than 16 bytes (send by
> appl_write() ) ?

I haven't used appl_read in quite a while, but here is what I can
recall...

Your program has a normal event loop. Once you receive a message event,
check that the third word of the message. If it is non-zero, this is the
length of the message beyond the standard eight words. (in this case
"word" refers to a "16 bit signed integer") You use appl_read() to
retrieve these words.

A sample piece of code (I've left out the normal scaffolding):

#include "0/types.h" // "sint16", "uint16" etc

#include <aes.h> // GEM prototypes

sint16 ap_id; // AES process ID
sint16 msg[24]; // longer message buffer than normal !!
sint16 ev; // event type
uint16 quit; // quit flag
OBJECT *menubar; // pointer to menubar

int main( void )
{
ap_id = appl_init();
rsrc_load( "a.rsc" );
rsrc_gaddr( R_TREE, MENU, &menubar );
menu_bar( menubar, 1 );
while( !quit ) {
ev = evnt_multi( MU_MESAG|MU_TIMER, ... );
if( ev & MU_TIMER ) {
quit = 1;
}
if( ev & MU_MESAG ) {
switch( msg[0] ) {
case MSG_CODE: // custom over-length message
if( msg[2] ) // read excess bytes into rest of
```

```
msg buffer
appl_read( ap_id, msg[2], &msg[8] );
do_something();
break;
case DIE: // custom 8 word message
quit =1;
break;
case MN_SELECTED: // standard AES message
mn_selected( msg );
break;
}
}
}
menu_bar( menubar, 0 );
rsrc_free();
appl_exit();
}
```

Thanks Hans,

I am looking for time resolution of > the 200 Hz timer, 1mS would be fantastic.

It is for a Midi application, currently I poll the 200 Hz timer, then compare with my (next event time), send out MIDI if time is OK, then prepare for the next events, but onviously this runs into problems when there is too much other stuff eg user altering values in real time so the timer is polled too late and timing goes astray.

> What time resolution do you want? What kind off application will it be?
>
> Eevrything is possible on a ST!

I believe so!

I am not expert in GEM - just about competent. I have very poor manuals and information so your links should help, thank you.

Source record: 1418
Cross-posted to: comp.sys.atari.st,comp.sys.atari.programmer

Hi all,

I've uploaded STonX 0.6.7.3 on Source Forge and I was
trying to compile it on a latest x86 Debian Linux distribution.
And I have some problems. It fails at "configure" and "make"
passes, because the SVGALib doesn't seem to be installed.
I'm not root on the system, so I can't install any
package, unless on my home directory. I tried to
find "vga.h" "vgakeyboard.h" and all those other stuff
on the system, but there's none of them (they are
included in the "svga.c" source file). Is there a
manner to configure without SVGALib, or installing
SVGALib package, keeping in mind that I'm not root ?

Thanks for help,

Regards,

The 'format' you mention is a low level device thing and is non platform
specific, what is important is the partitioning scheme you used.

One way to find out for sure is to try it. If it fails and you still have
the bird handy you could copy all the contents off the Jazz and re-
partiton it to a PC compatible scheme and then copy everything back.
Long and involved but it'l work.

You could check for the magic cookie 'MagX'.

Alternativley, fake a call that you know is magic-specific and act on the
return code.

Probably what you need to do is modify the configure.in file,
install autoconf on your machine if it is not yet installed,
and re-create the configure script. Commenting out all lines
containing 'svga' could probably do the trick. Note, however,
that the comment in configure.in is 'dnl'. (Je sais, ï¿½a ne
s'invente pas !!!).

Thanks for your reply. Meanwhile I downloaded the devel SVGALibs
and I simply copy it to the STonX-0.6.7.3 directory. Then "configure"
and "make" did work. This makefile builds two version of STonX :
"stonx" and "stonvga". On my Linux box, SVGALib are not installed,
so "stonvga" doesn't work properly. But what works is the standard
"stonx", and that's all what I want. I'm wondering what is the
interest of "stonvga", that can't work with me, but that is well
built. Does "stonvga" allows better resolutions ? Am I missing
something ?

That's nice of you to have replied,

stonvga gives you more the feeling to really sit in front of an ST,
because there is nothing other on your desktop. Apart from that it
just maps Atari memory into the Linux Framebuffer (which can also be
done on X11 with the shared memory extension of X11). Some people try
to build an X11 based VDI, which works natively. This then would be
much faster, than an emulated one.
Me myself do more like the native work - fVDI e.g., which also works
on X11 as on SVGAlib. In the end it does not matter. X11 may be better
for developers. You can have the emulator on the left, end you IDE on
the right.

Martin

Yes, you can use the X11 Interface, which works just fine. For running
an SVGAlib program you need to be root.

For X11 just write

make stonx

>Alternativley, fake a call that you know is magic-specific and act on the
>return code.

Lattice C doesn't include much info about the cookie jar, only machine
type and a couple of others. I could test if magxboot.prg is prg or
prx but I know this is the worst possible way to test if it is in
memory.

I'm trying to think of some Magic calls....

Thanks

Lyndon Amsdon

>>Alternativley, fake a call that you know is magic-specific and act on
>>the return code.

>Lattice C doesn't include much info about the cookie jar, only machine
>type and a couple of others.

So utilise that info and look for "MagX"

>I could test if magxboot.prg is prg or prx but I know this is the worst
>possible way to test if it is in memory.

That would fail on my machine as i use magxbo32, dead end here.

>I'm trying to think of some Magic calls....

Here doggie!!

Start with the cookie jar dude.

Just add this to a relevant header file...

```
#ifndef MiNT_COOKIE
#define MagX_COOKIE 0x4D616758L
#define MiNT_COOKIE 0x4D694E54L
#endif
```

If it's a GEM application you're writing, then testing for "its" cookie
is probably the most elegant solution.

Later,
Karlos.

Hi, Laurent!

To leave STonVGA you just have to press <F12>. Then you should get
back your commandline.

SVGAlib always needs to be configured in

/etc/vga/<don't know exactly>

There you have to set your mouse. Mine is PS2. Also - if your card is
not directly supported - please set "VESA mode" hard.

Martin

Reading the cookie jar in C isn't that hard. Here a snip from a program I
wrote. Just replace the standard cookies with the ones you want to check
for.

```
{ /* detect machine type */
long *jar=*(long**)0x5a0;
if(jar!=NULL)
{
printf("Cookie Jar found!\n");
while(*jar!=0)
{
if(*jar=='_MCH')
{
game.machine=(int)((jar[1])>>16);
printf("Machine type: %i\n", game.machine);
}
if(*jar=='_SND')
{
game.sound=(int)(jar[1]);
printf("Sound hardware: %i\n", game.sound);
}
jar+=2;
}
}
else
{
printf("No cookie Jar found!\n");
}
game.sversion=Sversion();
printf("GEMDOS version: %X\n", game.sversion);
}
```

Bye, Hans Wessels

It is always possible to look into the cookie jar, unless
the jar is not set up, in which case *(long*)0x5a0 is null.
However you will perhaps not find the relevant info in the
jar if the program/feature you're looking for has not
been installed/run yet.

You must know if the code you want to change is part of a switch statement.
Use ALT+f to find indirect jumps, these can be switch statements.
If so, resolve the relevant switch statements by finding out how long the table of
displacement values is, then mark it as jump table. (select, and press <j>).
This way you get labels to the relevant switch parts.
If you have these labels, it is possible to insert new instructions.

Dont change the data and bss segments. Put new variables at the end.

I think there is some confusion here about what a RSC file is.
Probably brought about by someone at microsoft not really understanding
what NeXT was doing with their programming enviroment.

Basically you have to through alot of Visual Basic ideas out if
you want to work with the atari and RSC files. You can do it yourself,
but that's exactly it you have to do it yourself. RSC files are a way to
make a standard interface to a program that can easily be translated into
different languages. The Resource Construction Set concerns itself with
nothing more than the appearance and construction of the RSC.

If you want a specific button to do something with a RSC file you
have to code your program to do that. You load and init the RSC file.
Get the index pointers to the objects and watch the event calls to see if
the user is clicking on the specific button, if they are you run the code.

With C there were some people working on the idea of a system
where you directly linked routines to buttons etc. But this isn't how a
majority of people do the work.

I was sure there is a program that works with GFA to make it easier to
build a RSC file for a GFA program. Can't remember what the name of the
program is. In fact, I may have a copy of it somewhere. I will look...

4675. Outputing samples on a ST

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-09 10:11:10 UTC
From: ian <ian@dotqr.com>
Message-ID: <984133082.26379.0.nnrp-02.9e98e6ee@news.demon.co.uk>
Source record: 1444

The STe/TT/Falcon have handy XBIOS routines for outputing samples via the D2A using DMA, but the ST with its Yamaha chip doesnt. However, Ive heard quite a few games output samples. How do they do this - does anyone know of any source code examples?

Cheers. Ian.

4676. Random()

Newsgroup: comp.sys.atari.programmer
Date: 2001-03-09 15:50:10 UTC
From: elfsoft@mindspring.com
Message-ID: <98au3i$i34$1@slb6.atl.mindspring.net>
Source record: 1445

I just released a new version of my XBIOS Random() replacement
(TT030 and Falcon only).

I increased the "seed" in NVM from 4 bytes to 24 bytes. I update
this value each reboot using RSA public key encryption:

x = (x * x * x) mod pq

Also, every installation gets a different RSA key (pq).

The idea is that even if someone reads the value in NVM off your
computer, they can't work backwards to determine what values
Random() was likely to have produced in previous sessions (or the
current one).

Since even true random quantities available to computers typically
produce only a couple of bits of randomness, the only way to really
improve on this method would be to increase the size of the "seed,"
and that is limited by the available space in NVM. (I suppose I
could keep the seed on disk, but I like finally having a good use
for NVM.)

BTW, if primes p and q are chosen so that (p-1)/2 and (q-1)/2 are
also prime (strong primes), then the number of x values before
repetition is ((p-1)/2 - 1)((q-1)/2 - 1) or approximately pq/4.
Also, x cannot be 0, 1, or any multiple of p or q.

Face Value. You simply create the interface in an RSC editor and Face
Value writes the program for you! After that all you have to do is to put
in your own routines, algorithms etc. to ge a fully working program.

It is just as easy as Visual Basic on pc. You hardly have to know
anything about eventdriven programming with a gui with windows, buttons,
etc, etc.

I only have version 1 but it was already a very good tool for fast
programming. It is still under development but now only in German(?)

There are some demos of its capabililty available for download on the Net.

Hallo Atari friends.

My name is Herald Witte.
A view weeks ago I recived from an friend and old Atari Portfolio HPC-006,
he had it stored in a shoobox and wasn't using it anymore so he gave it to
me.
I am verry pleased with it, but have one problem the documentation is gone,
and the mini RS232 cable to print and to connetc to the pc.
Is there any way to get the documentation of this product??

Product specifications:

Atari Portfolio HPC-006
16 bit personal computer

> this - does anyone know of any source code examples?

Playing a sample on a ST is quit a processortime consuming process. This is
how it works:

A timer interrupt is used to call a special routine for playing the sample.
This means to play a sample at 16 kHz the interrupt routine is called at a
frequency of 16 kHz.

To play a byte of the sample the interrupt routine has to do something like
this:

get the pointer to the byte of the sample to be played
get the byte to be played
add one to the pointer of the byte to be played
store the pointer to the byte to be played
use the byte to be played as index to a special sample table
copy 12 bytes from the sample table to the soundchip

in assembly it would look something like this:

sample_rout:
move.l a0,-(sp)
move.w d0,-(sp) ; save 2 registers
move.l sample_p,a0 ; sample pointer
clr.w d0
move.b (a0)+,d0 ; get byte to be played
move.l a0,sample_p ; store sample pointer
lea sample_table,a0 ; special sample table
lsl.w #4,d0 ; offset in table
add.w d0,a0 ; soundchip data
move.l (a0)+,$ffff8800.w ; copy bytes to soundchip
move.l (a0)+,$ffff8800.w ; copy bytes to soundchip
move.l (a0)+,$ffff8800.w ; copy bytes to soundchip
move.w (sp)+,d0
move.l (sp)+,a0
rte

DATA
sample_table:
```

```
dc.b ....... * a 4096 byte sample table *

TEXT
sample_p:
ds.l 1
```

I just typed in the code. It has never seen an assembler so I can't guarantee it wil work or even compile.

The sample table contains data for the volume registers of the three voices of the soundchip. The netto effect is (about) the right analouge value for the byte to be played at the soundchip's output.

How to get as sample table? Hard one...

<couldn't find one on the web>

Well, flame me, here is one.

I am not 100% sure whether it is for signed or unsigned samples. From the looks of it I would say unsigned samples.

Succes, Hans
